Solar Flares and Coronal Mass Ejections (CMEs)

Solar Flares and Coronal Mass Ejections (CMEs)

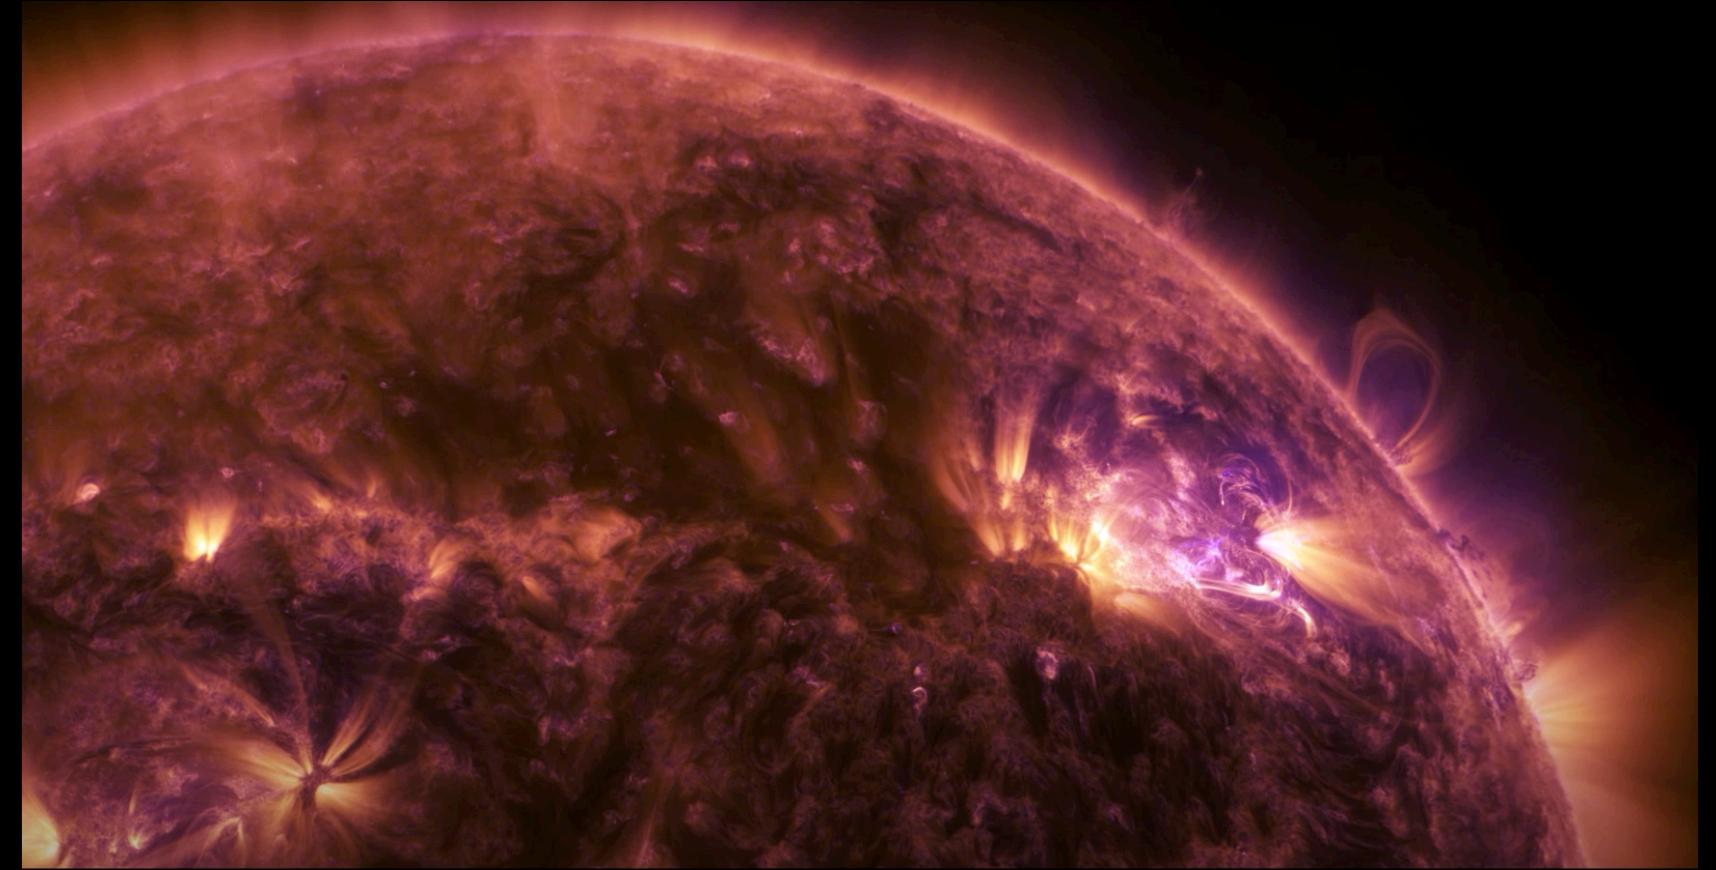

Solar Flares and Coronal Mass Ejections (CMEs)

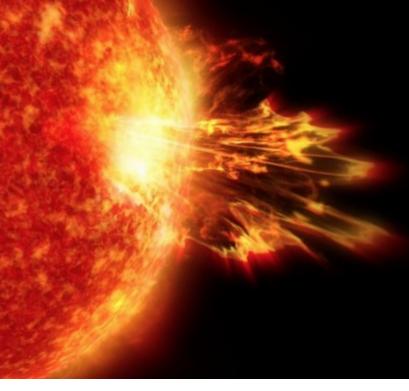

- Solar Flares

Solar Flare

Coronal Mass Ejection

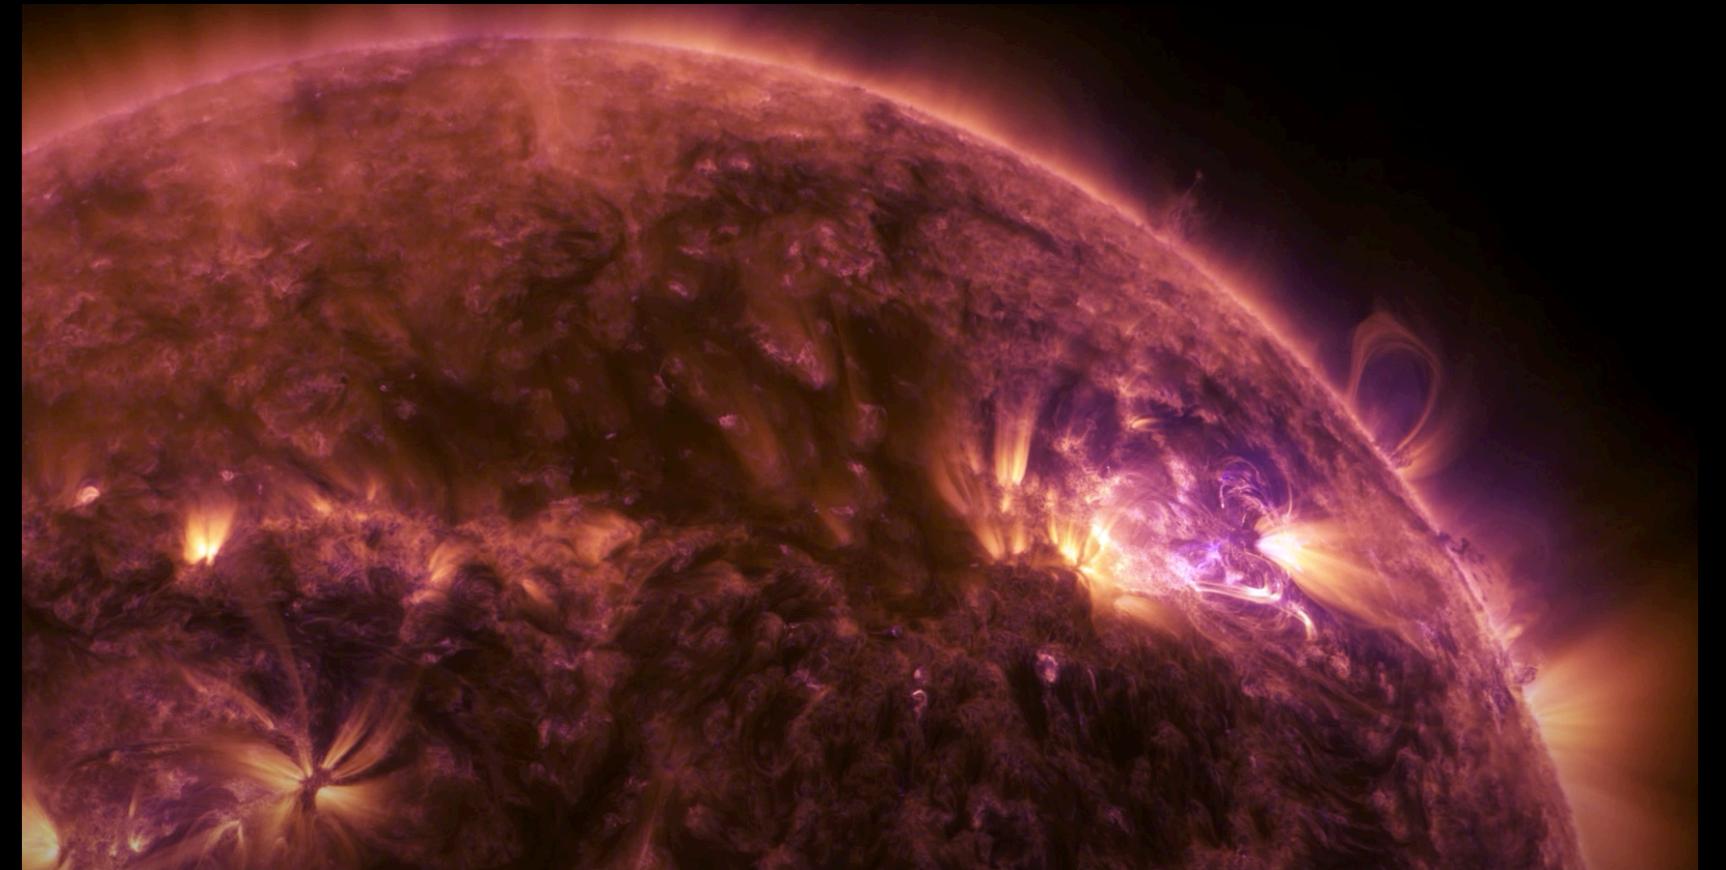

Solar Flares and Coronal Mass Ejections (CMEs)

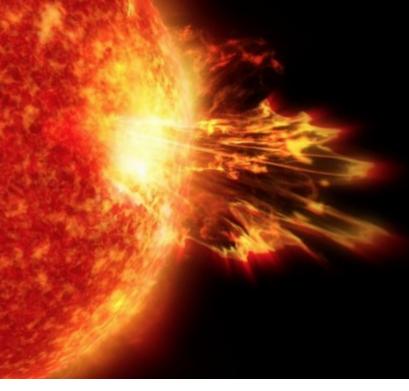

- Solar Flares
 - Large amounts of emitted energy as electromagnetic radiation

Solar Flare

Coronal Mass Ejection

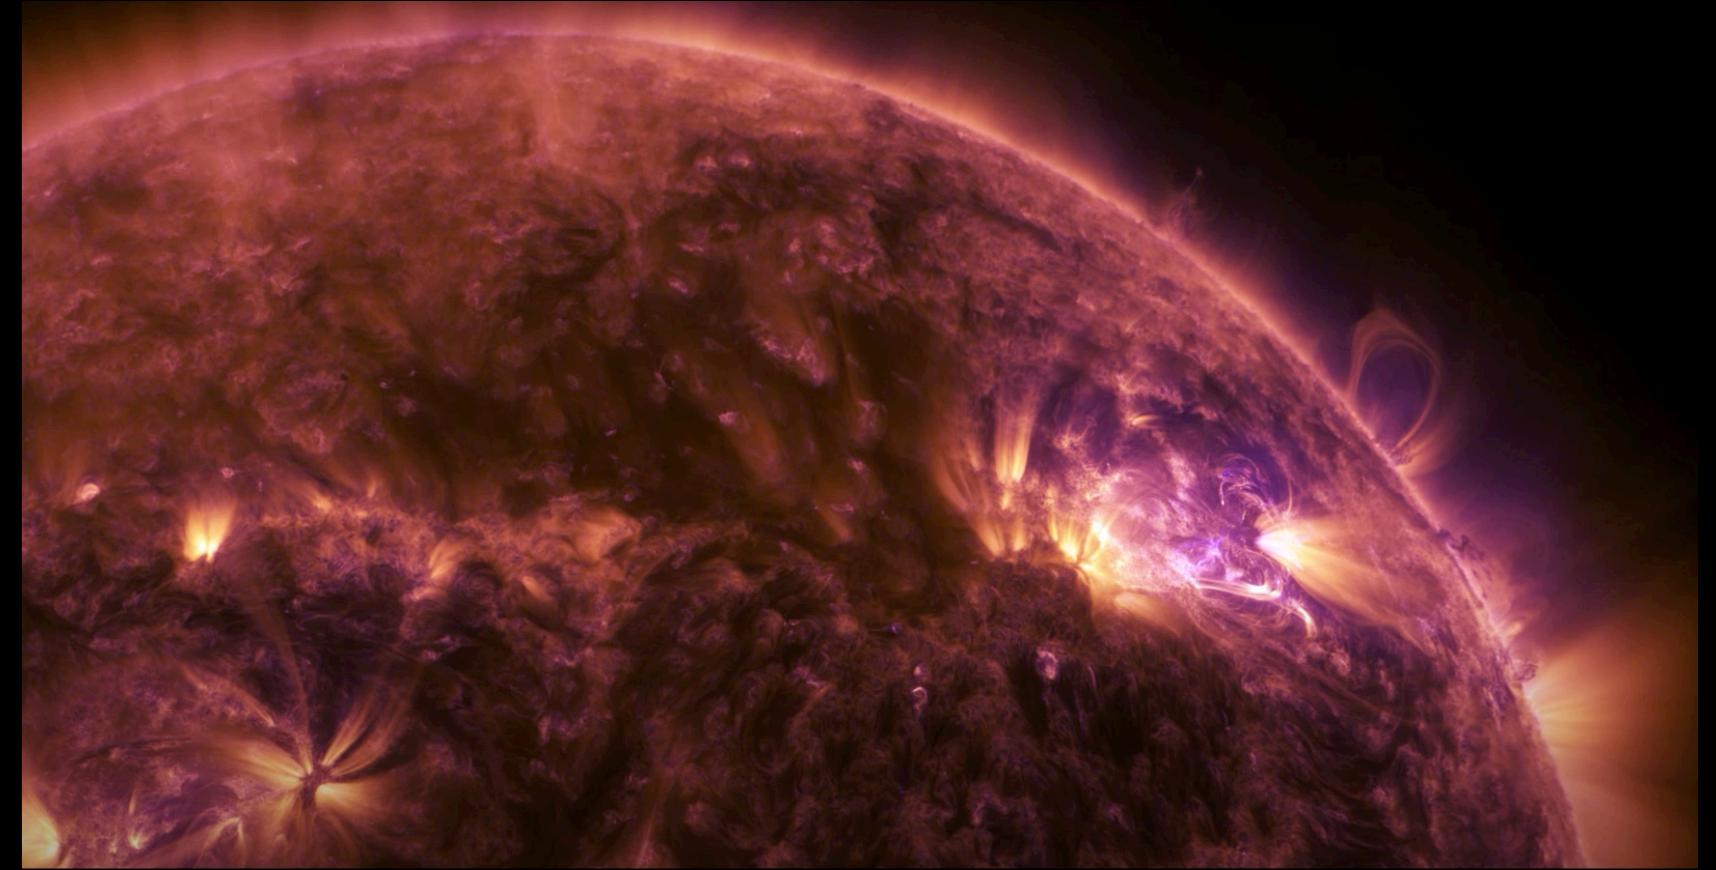

Solar Flares and Coronal Mass Ejections (CMEs)

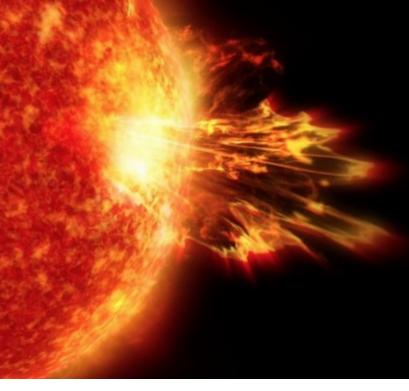

- Solar Flares
 - Large amounts of emitted energy as electromagnetic radiation
 - Reach the earth in 8 minutes

Solar Flare

Coronal Mass Ejection

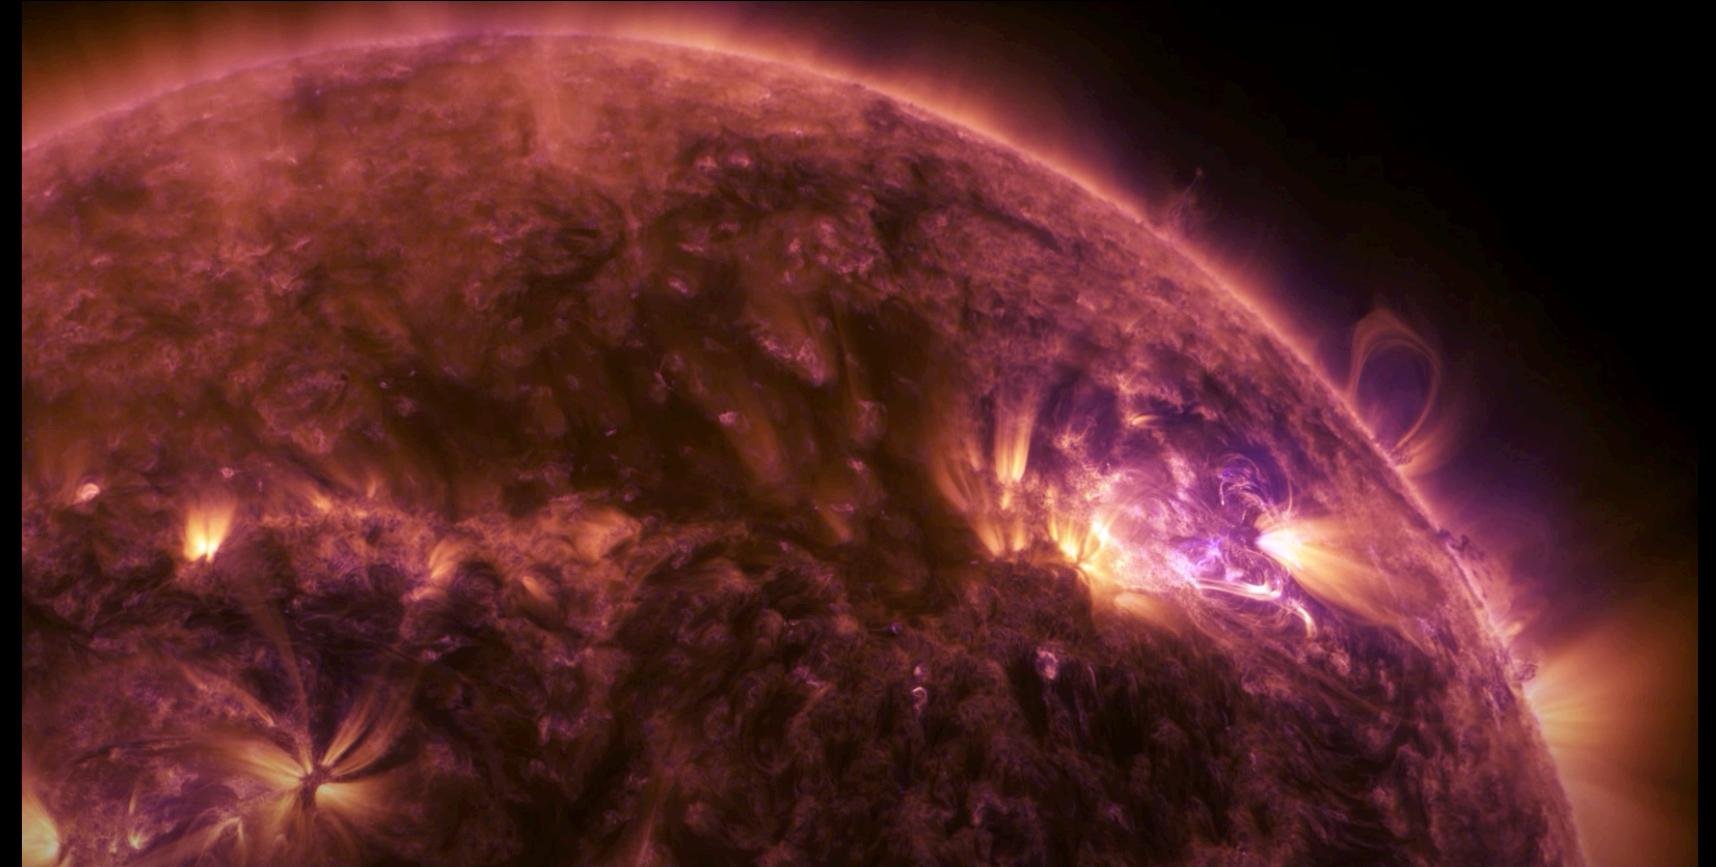

Solar Flares and Coronal Mass Ejections (CMEs)

- **Solar Flares**

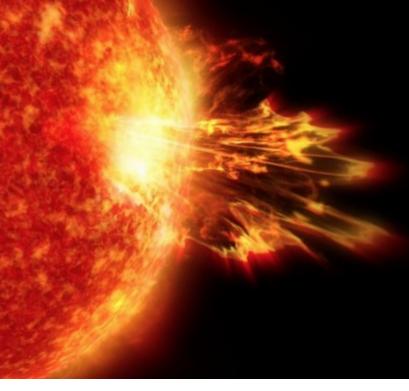

- Large amounts of emitted energy as electromagnetic radiation
- Reach the earth in 8 minutes
- Mostly affect only the upper layers of the atmosphere

Solar Flare

Coronal Mass Ejection

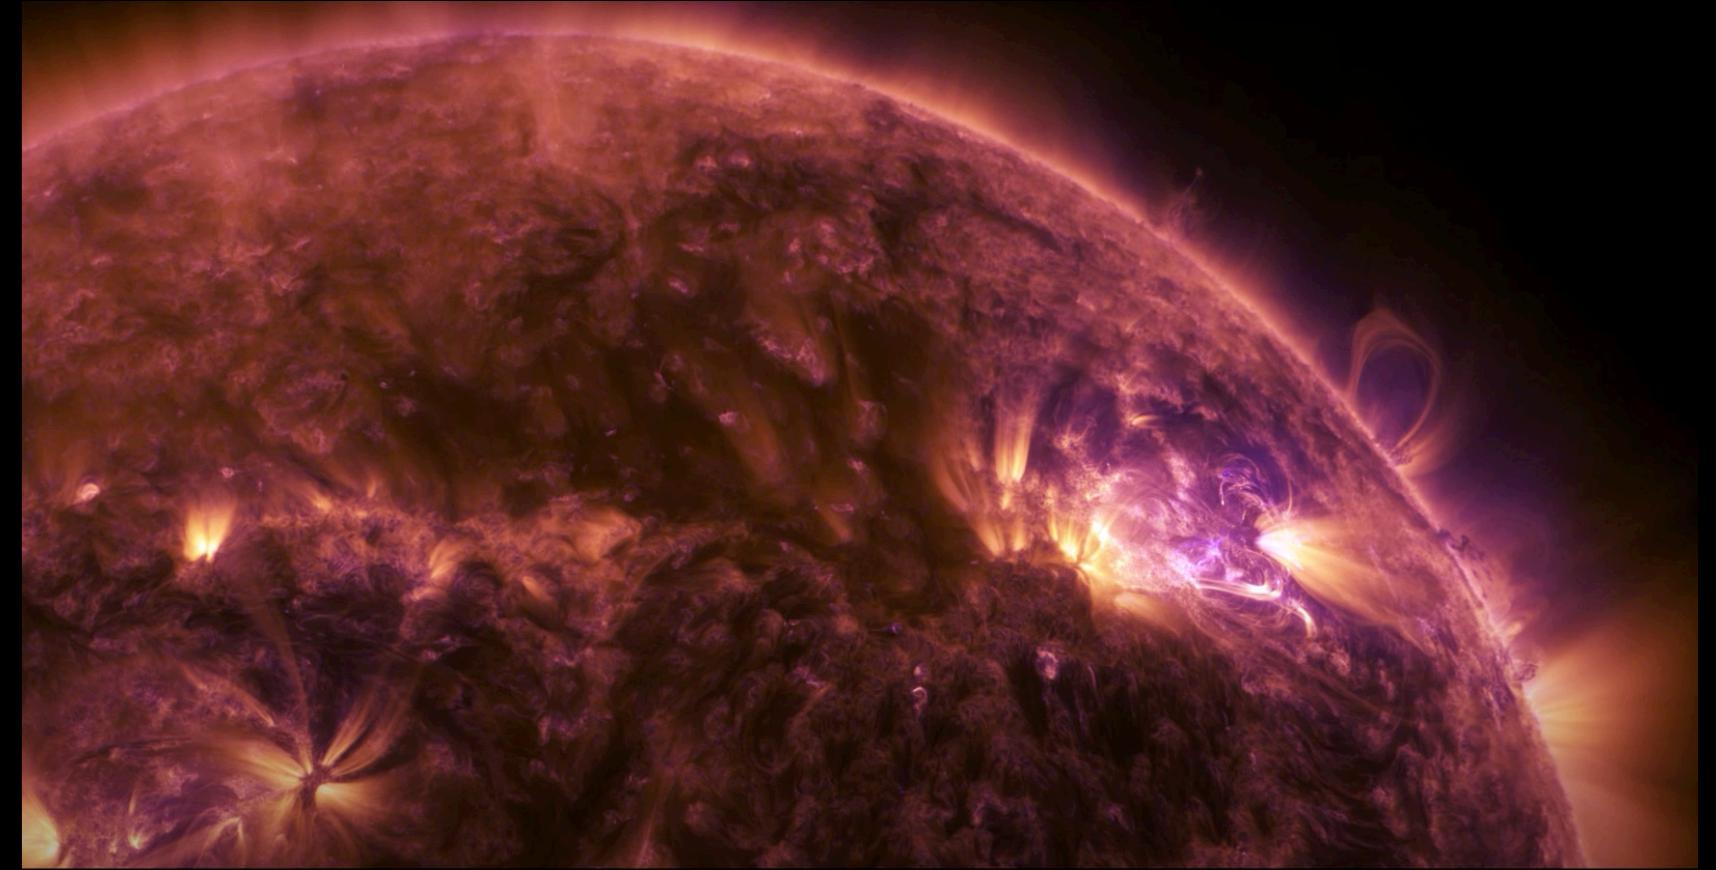

Solar Flares and Coronal Mass Ejections (CMEs)

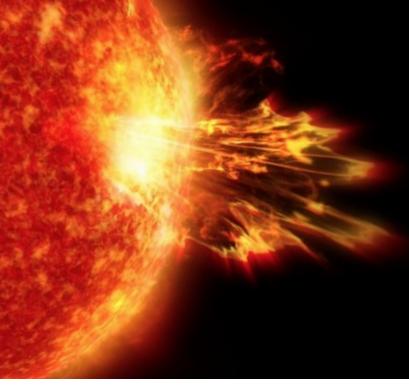

- Solar Flares
 - Large amounts of emitted energy as electromagnetic radiation
 - Reach the earth in 8 minutes
 - Mostly affect only the upper layers of the atmosphere
- Coronal Mass Ejections (CMEs)

Solar Flare

Coronal Mass Ejection

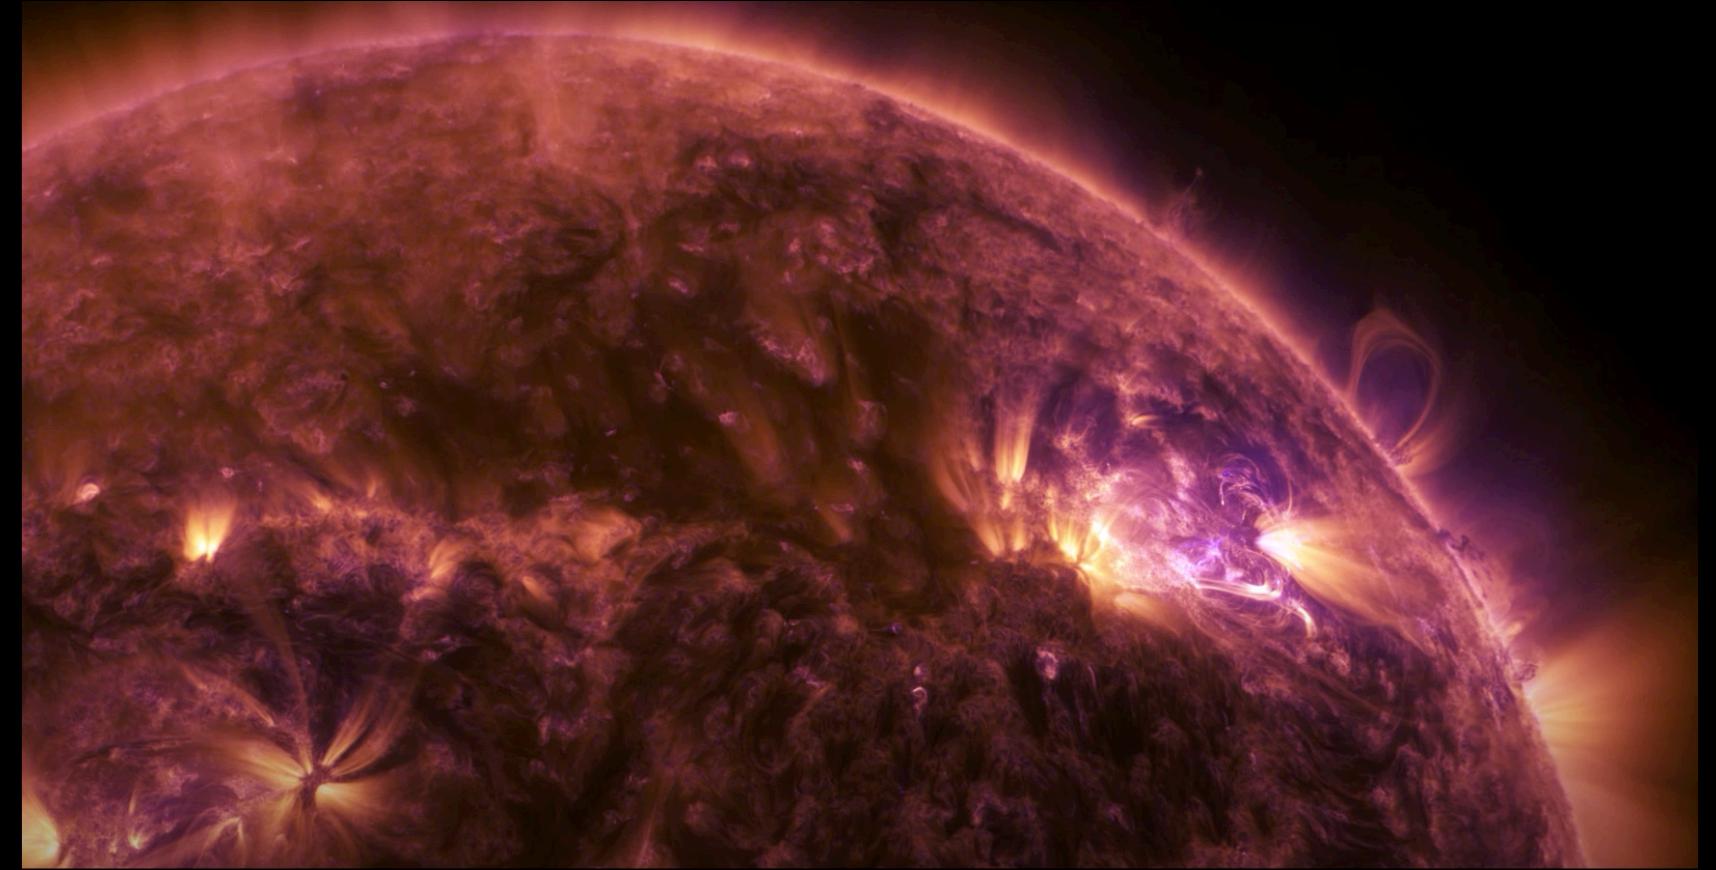

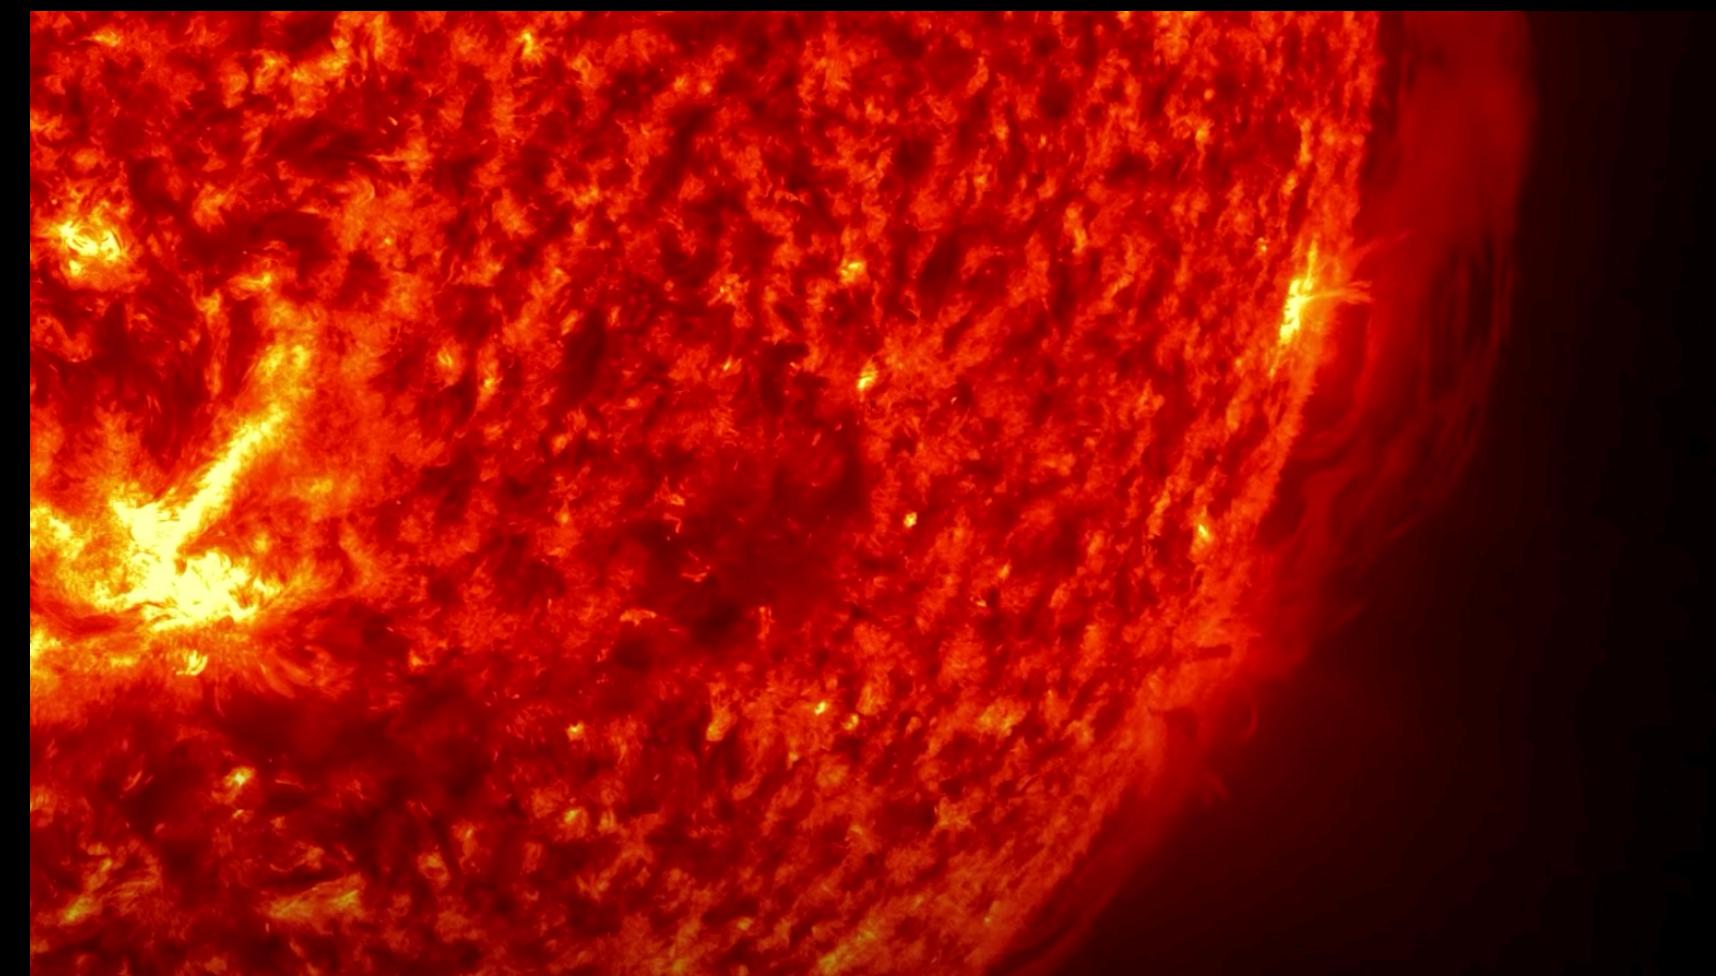

Solar Flares and Coronal Mass Ejections (CMEs)

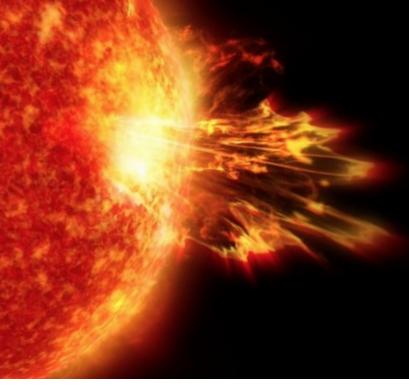

- **Solar Flares**
 - Large amounts of emitted energy as electromagnetic radiation
 - Reach the earth in 8 minutes
 - Mostly affect only the upper layers of the atmosphere
- **Coronal Mass Ejections (CMEs)**
 - Emission of electrically charged solar matter and accompanying magnetic field into space

Solar Flare

Coronal Mass Ejection

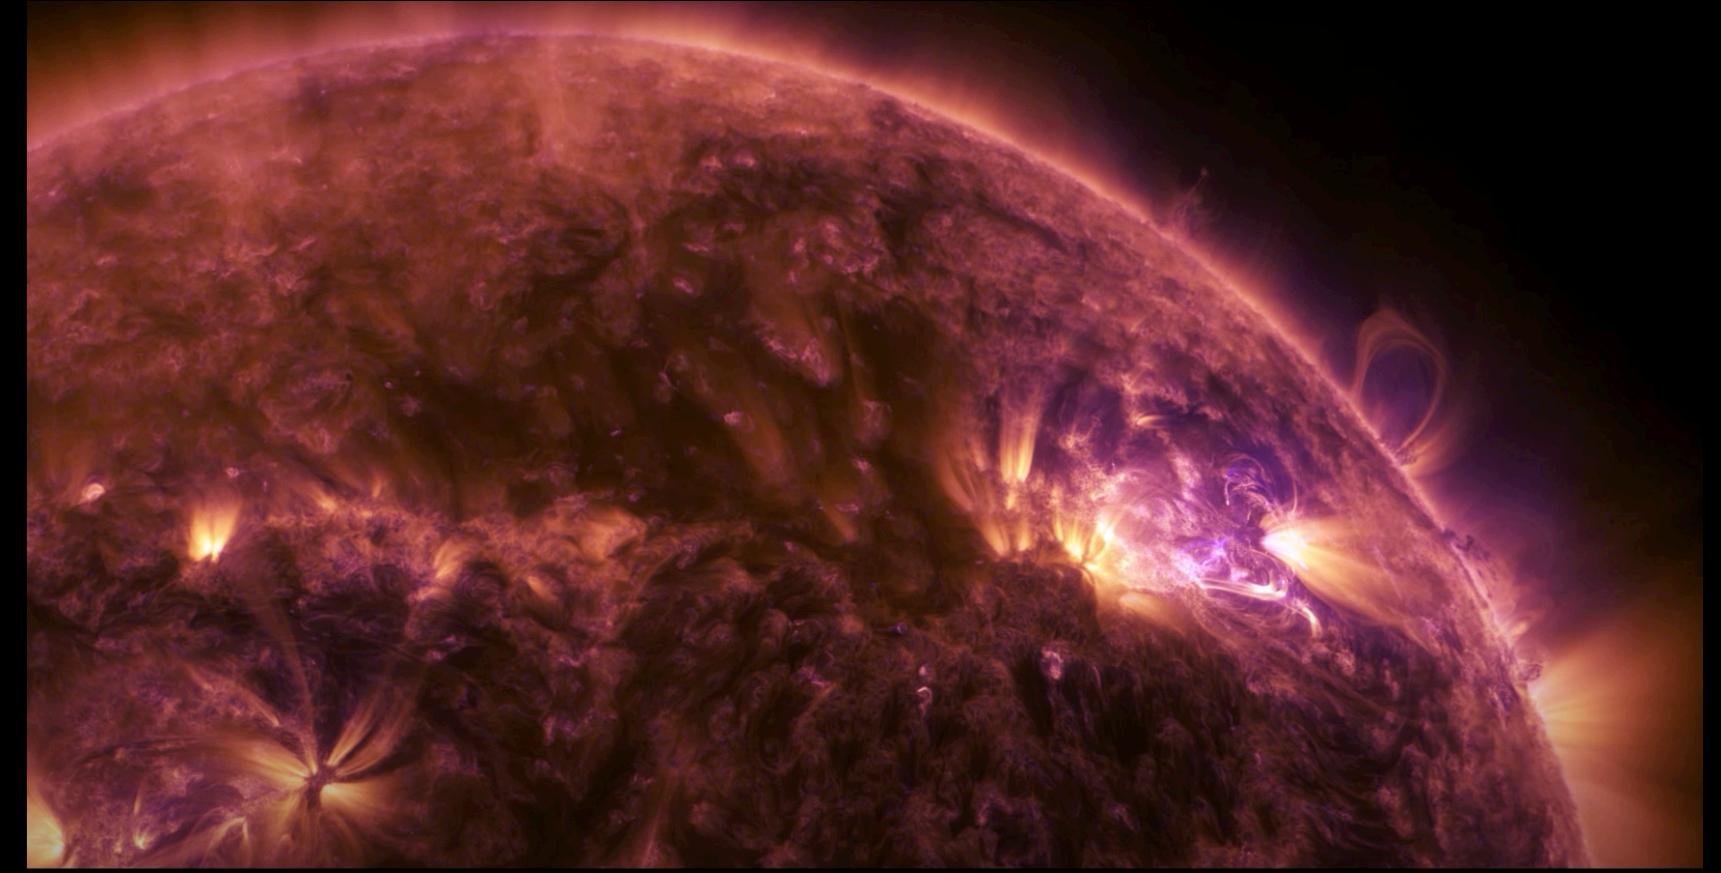

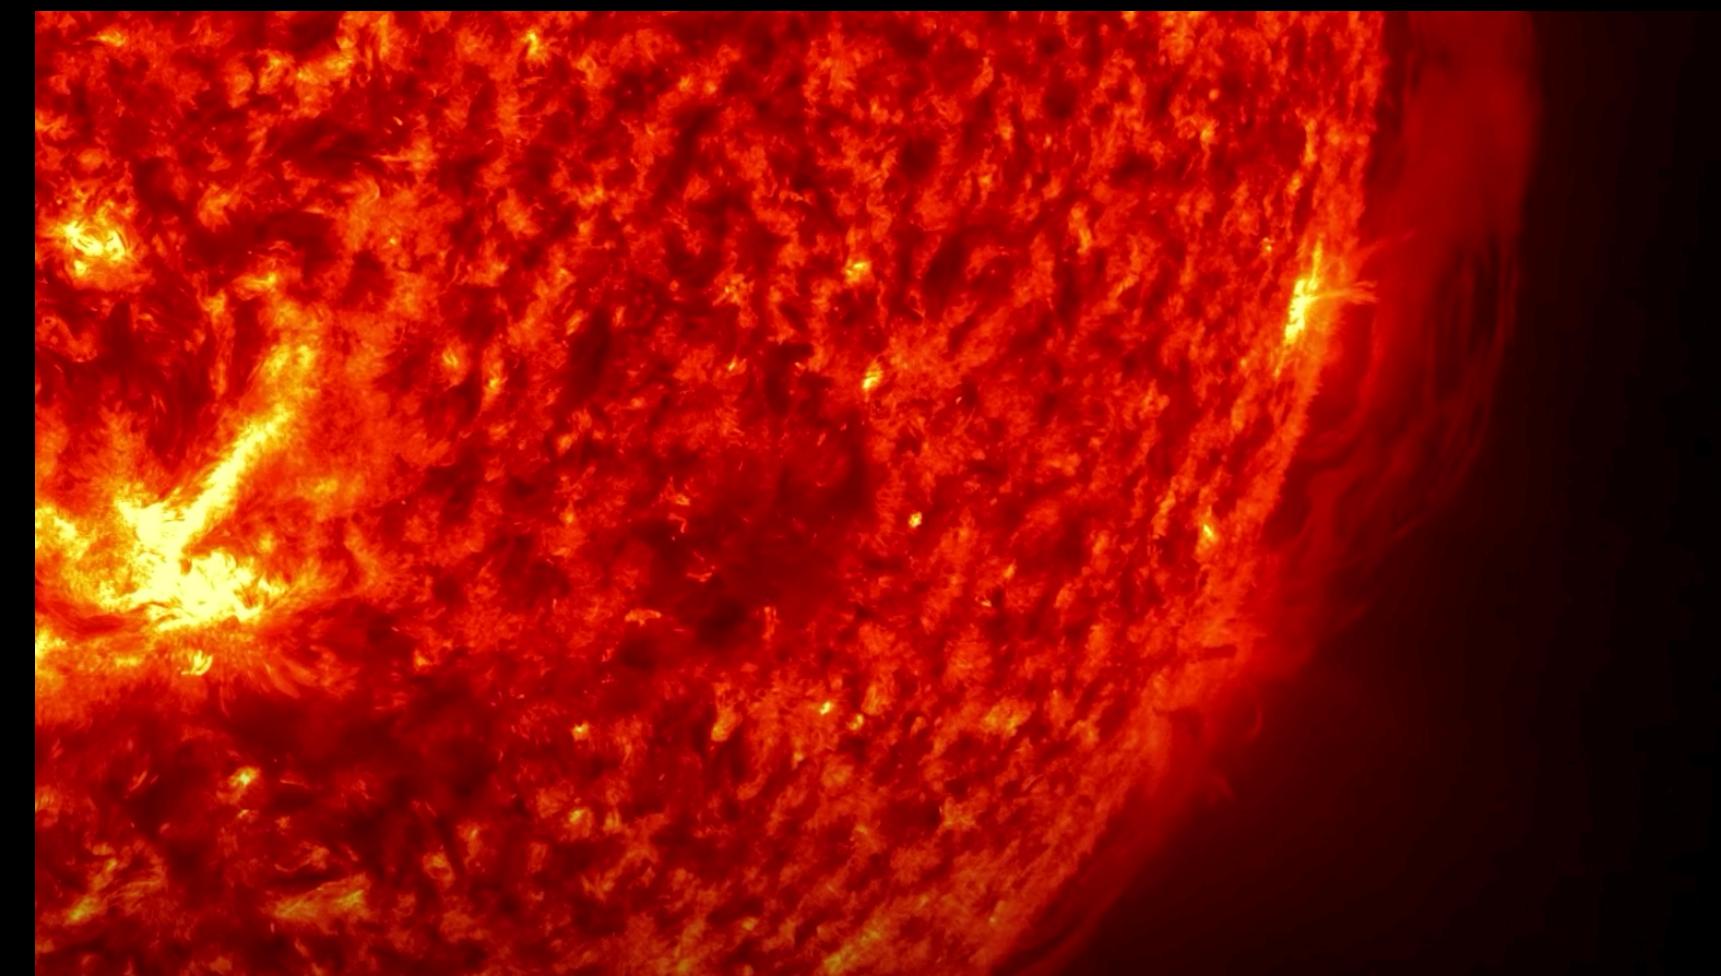

Solar Flares and Coronal Mass Ejections (CMEs)

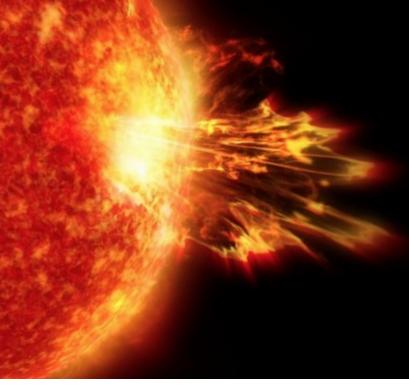

- **Solar Flares**
 - Large amounts of emitted energy as electromagnetic radiation
 - Reach the earth in 8 minutes
 - Mostly affect only the upper layers of the atmosphere
- **Coronal Mass Ejections (CMEs)**
 - Emission of electrically charged solar matter and accompanying magnetic field into space
 - Take 13 hours-5 days to reach the earth

Solar Flare

Coronal Mass Ejection

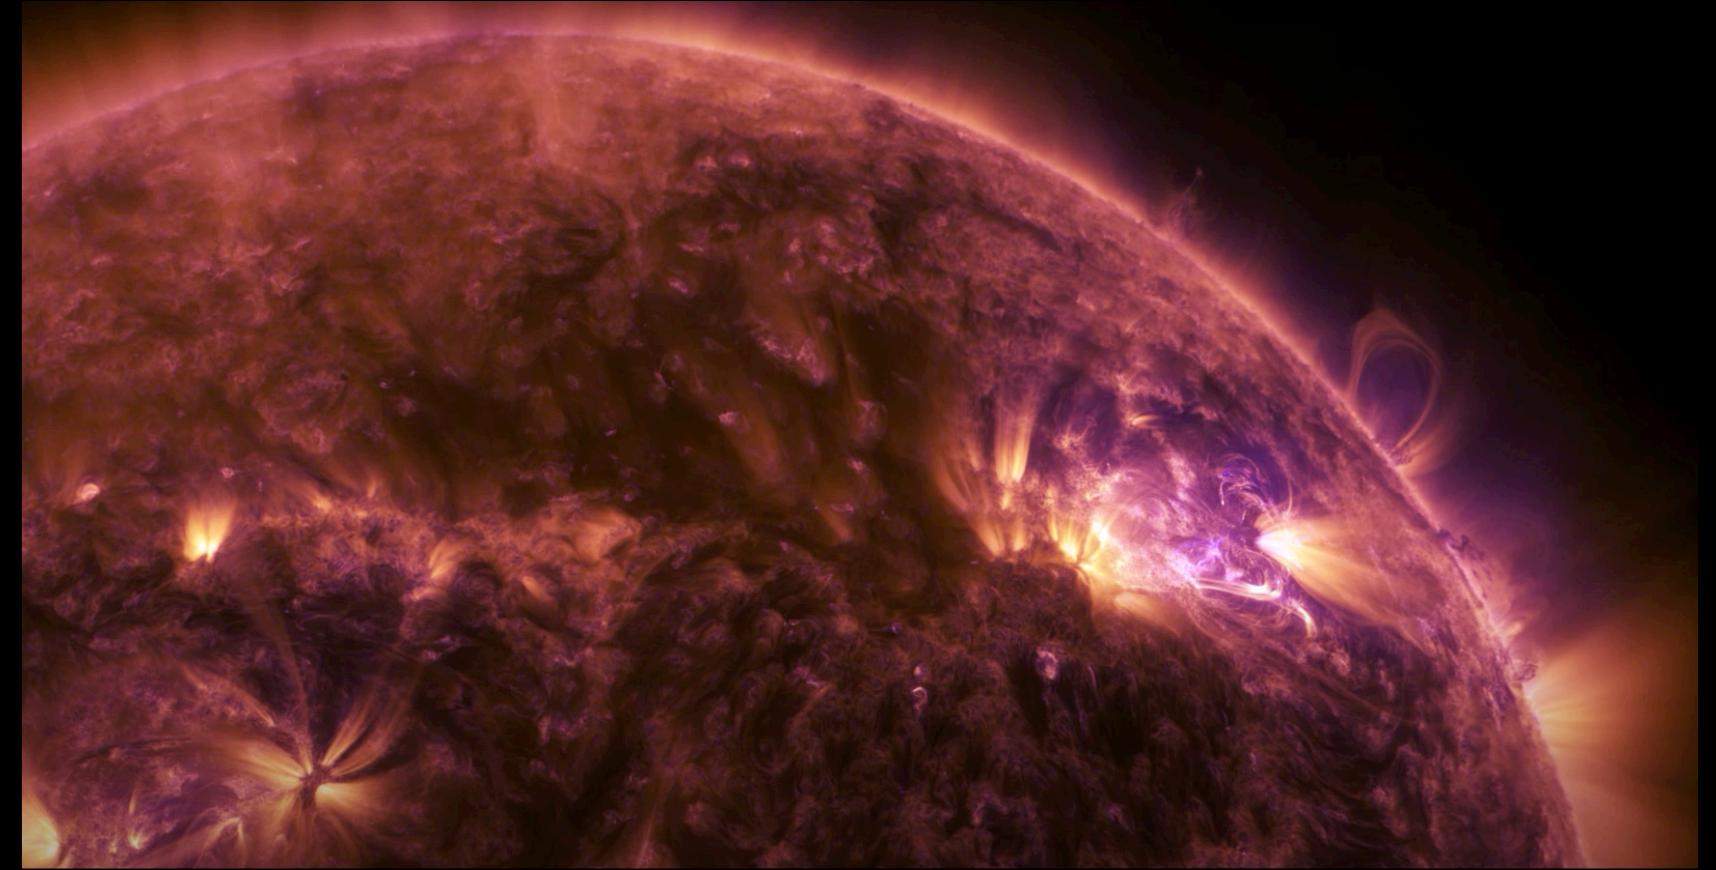

Solar Flares and Coronal Mass Ejections (CMEs)

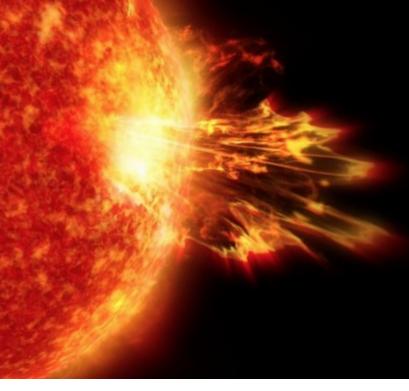

- **Solar Flares**
 - Large amounts of emitted energy as electromagnetic radiation
 - Reach the earth in 8 minutes
 - Mostly affect only the upper layers of the atmosphere
- **Coronal Mass Ejections (CMEs)**
 - Emission of electrically charged solar matter and accompanying magnetic field into space
 - Take 13 hours-5 days to reach the earth
 - Can affect terrestrial infrastructure

Solar Flare

Coronal Mass Ejection

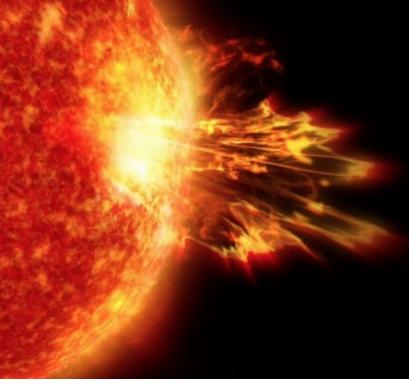

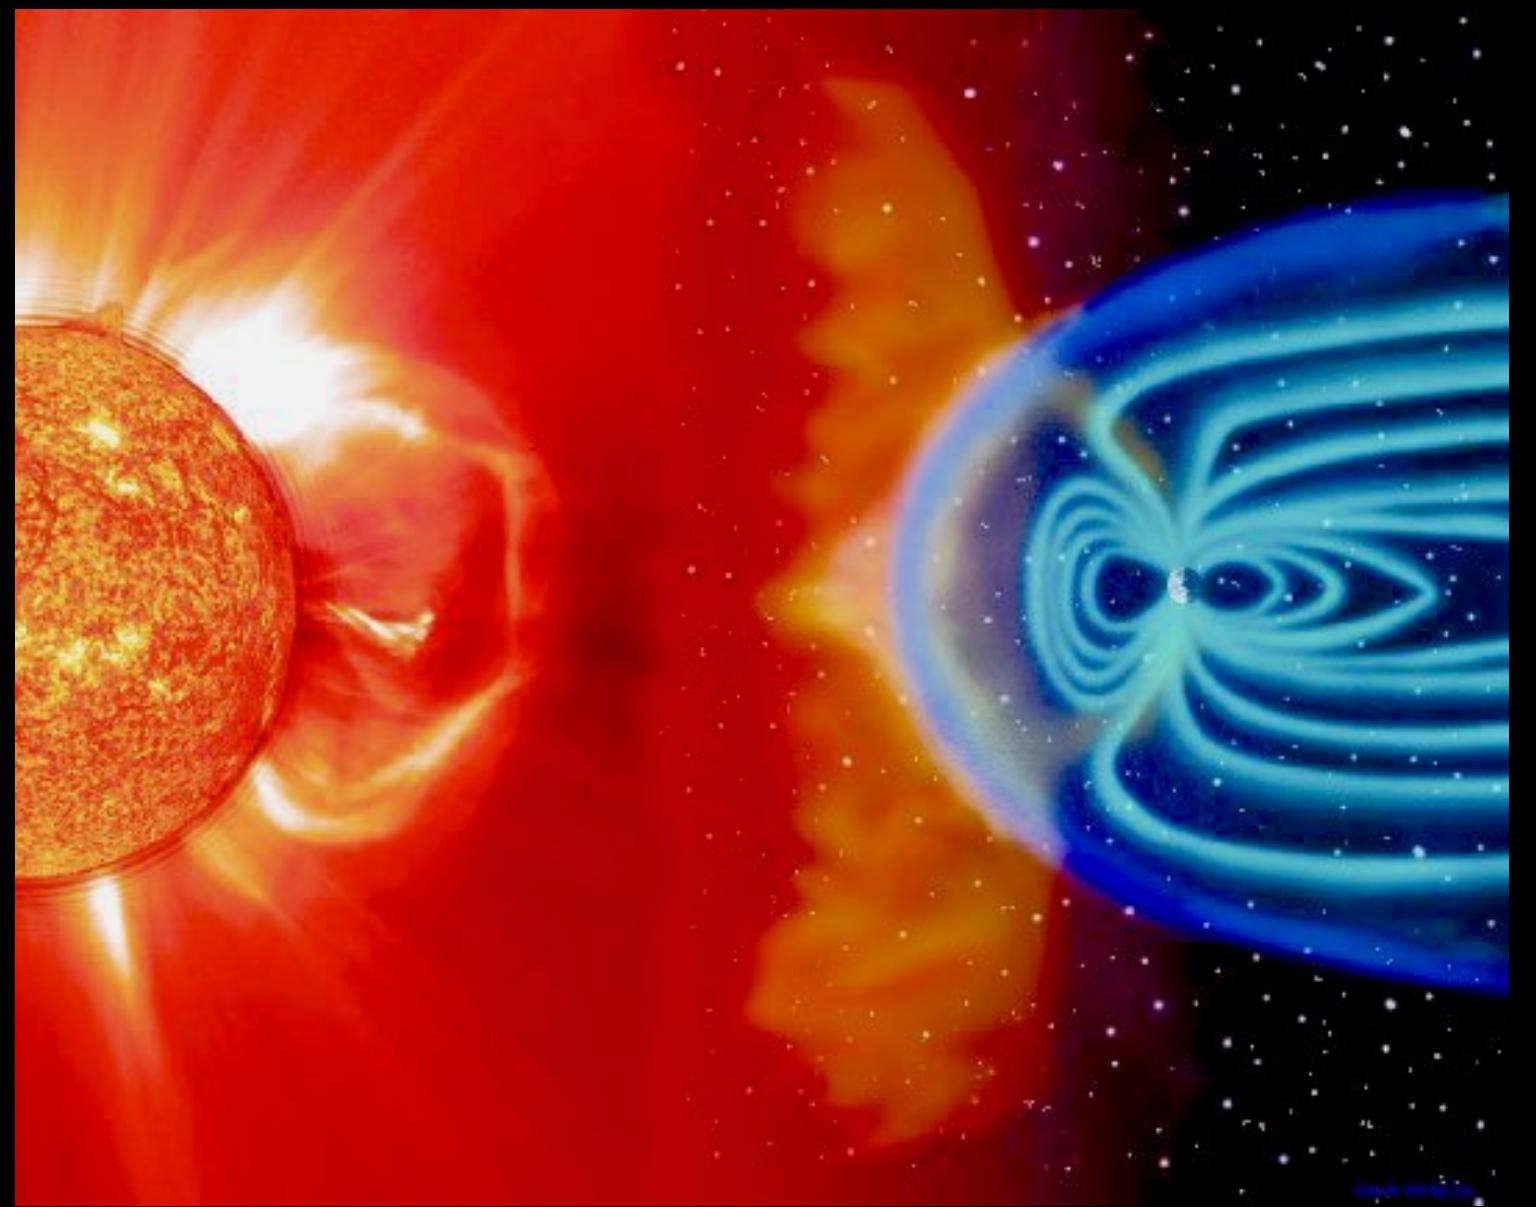

Solar Flares and Coronal Mass Ejections (CMEs)

- Solar Flares
 - Large amounts of emitted energy as electromagnetic radiation
 - Reach the earth in 8 minutes
 - Mostly affect only the upper layers of the atmosphere
- Coronal Mass Ejections (CMEs)
 - Emission of electrically charged solar matter and accompanying magnetic field into space
 - Take 13 hours-5 days to reach the earth
 - Can affect terrestrial infrastructure
- Both solar flares and CMEs often originate near sunspots

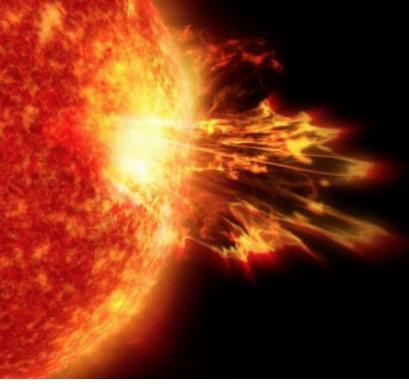

How do CMEs affect us?

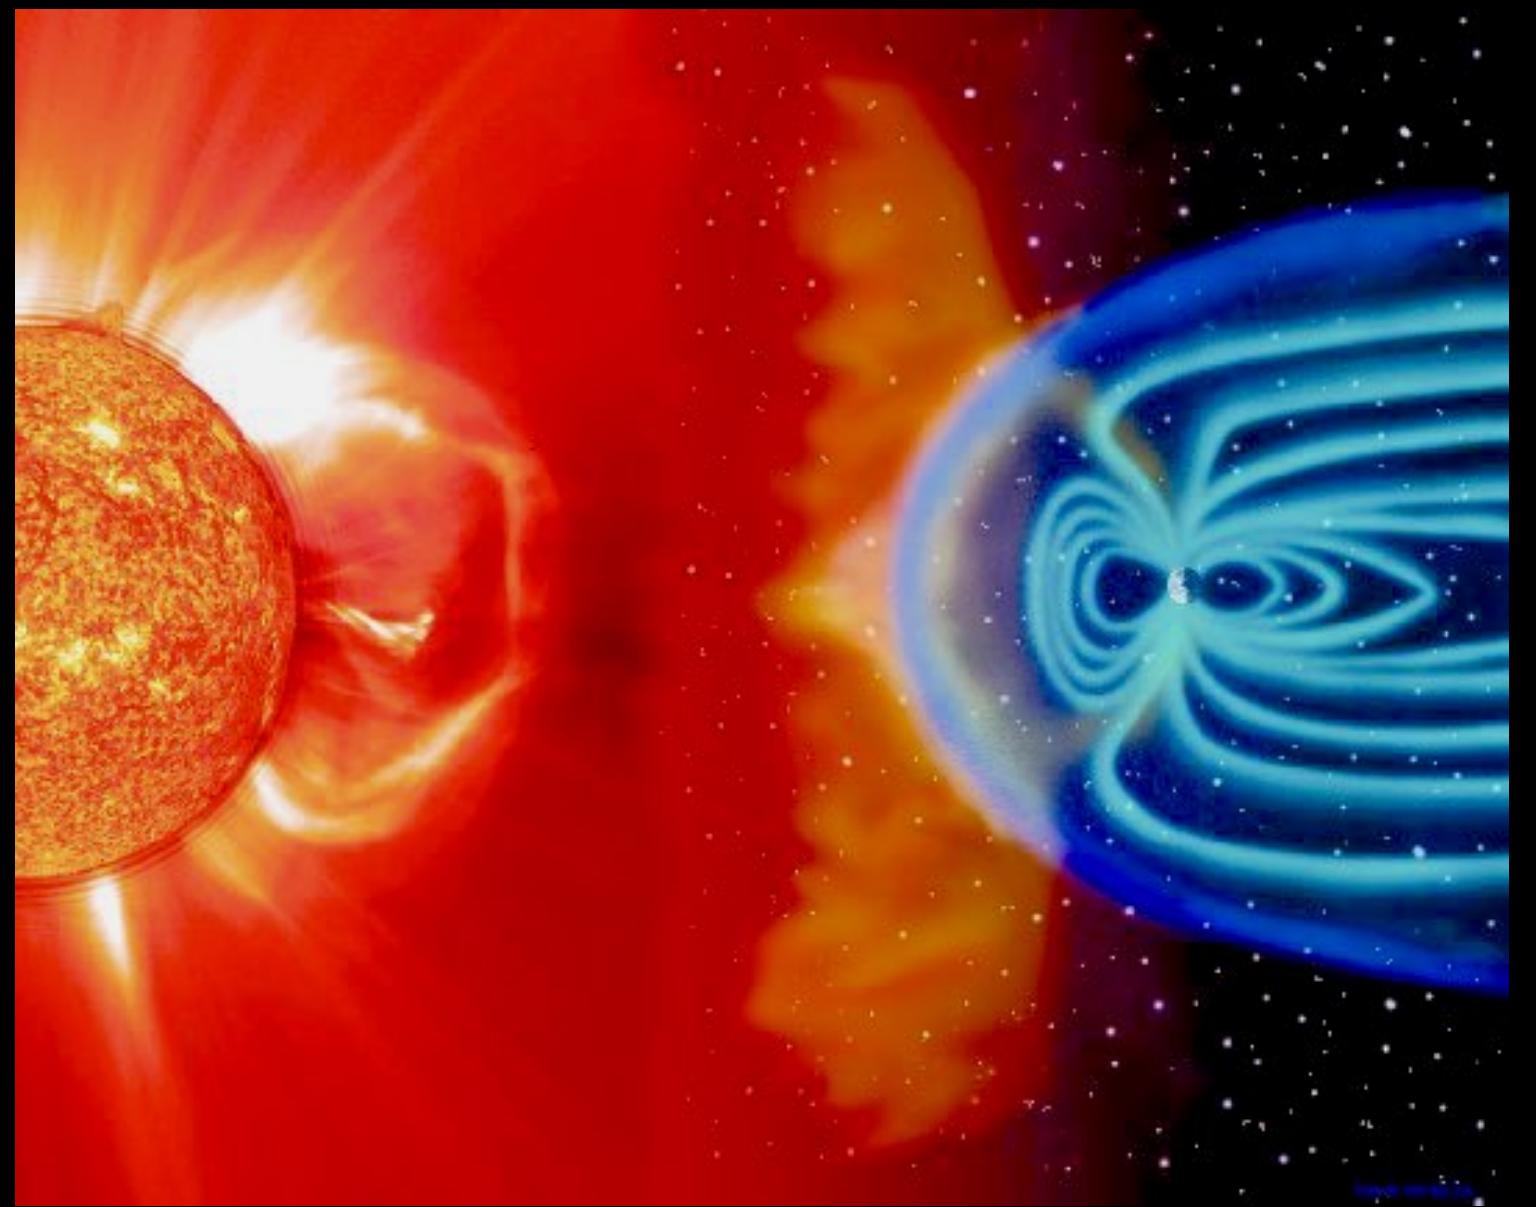

Credits: NASA's Goddard Space Flight Center/SDO

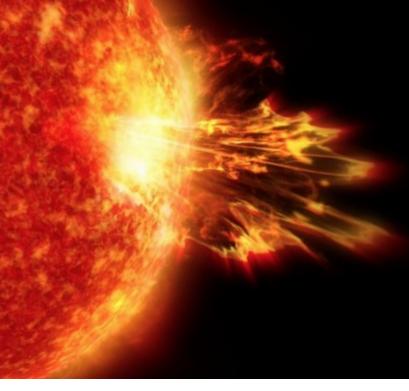

How do CMEs affect us?

- The magnetized emissions are highly directional

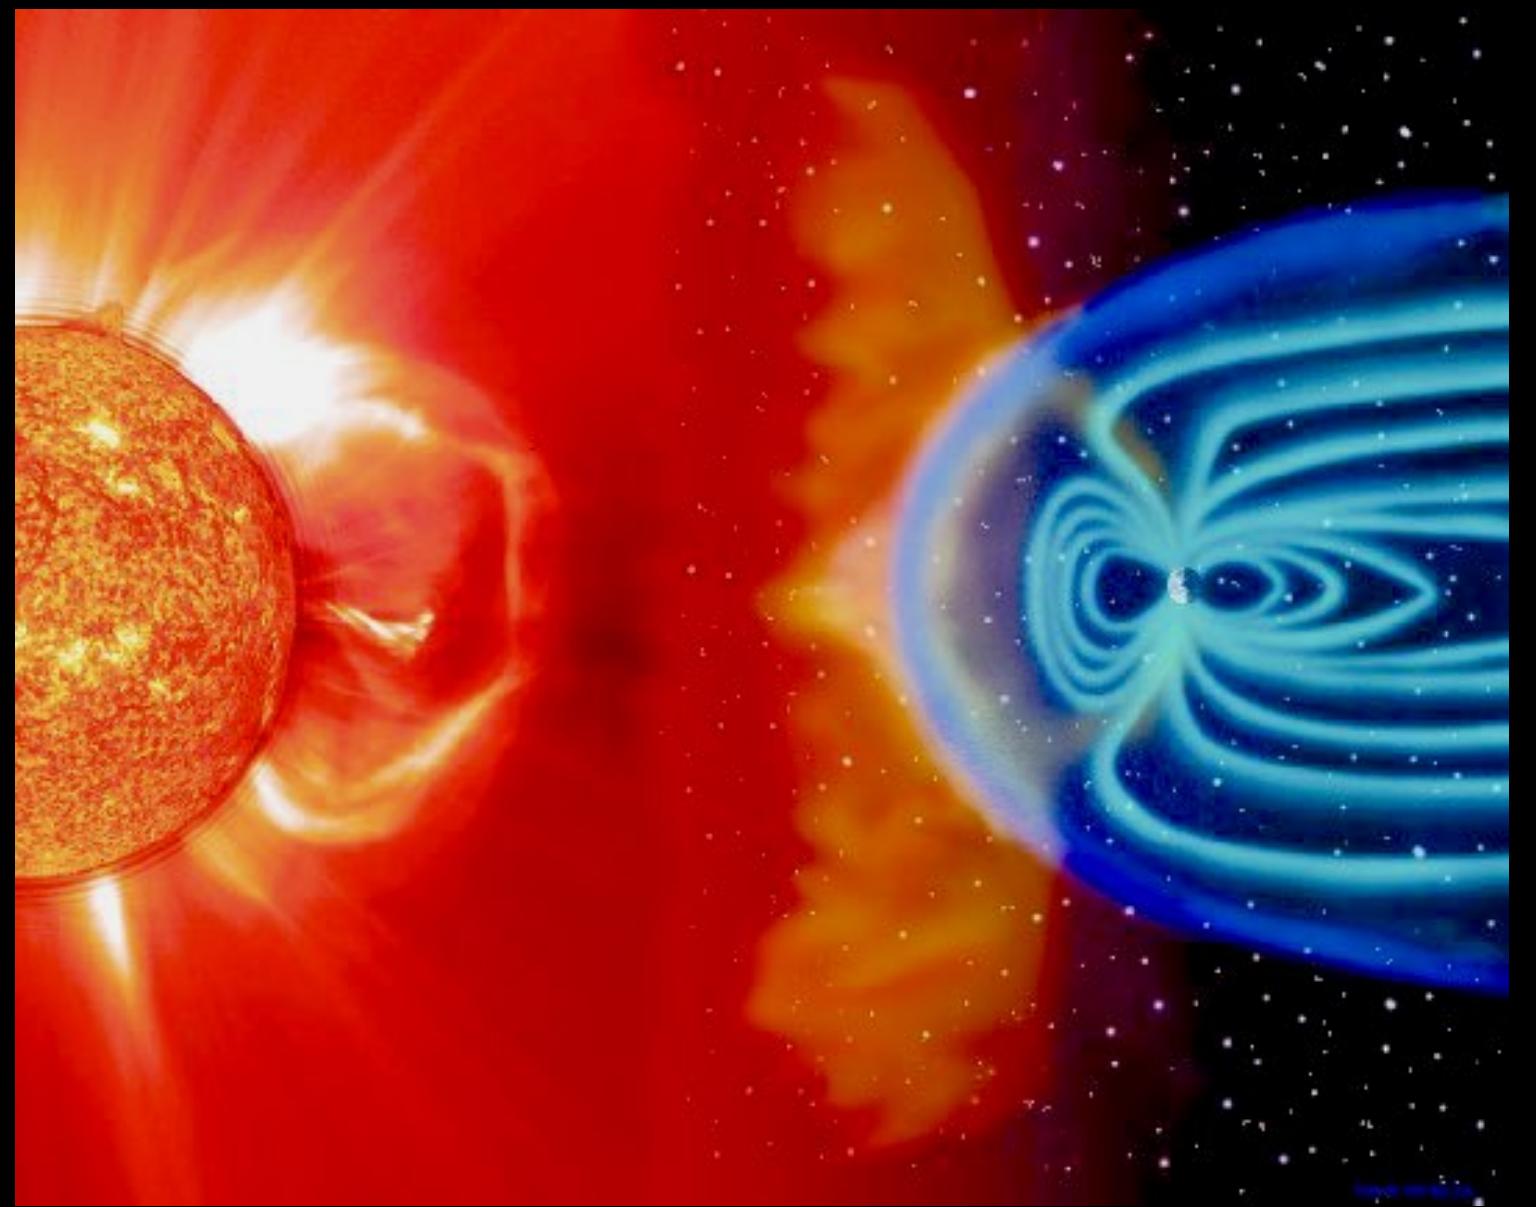

Credits: NASA's Goddard Space Flight Center/SDO

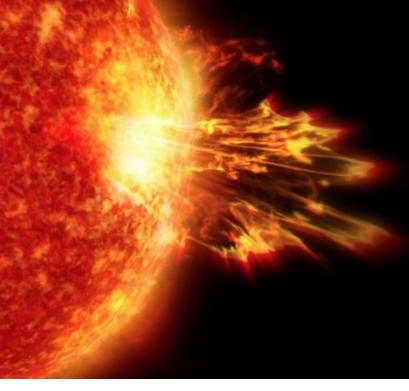

How do CMEs affect us?

- The magnetized emissions are highly directional
- When the earth is in the direct path of a CME, it interacts with the earth's magnetic field

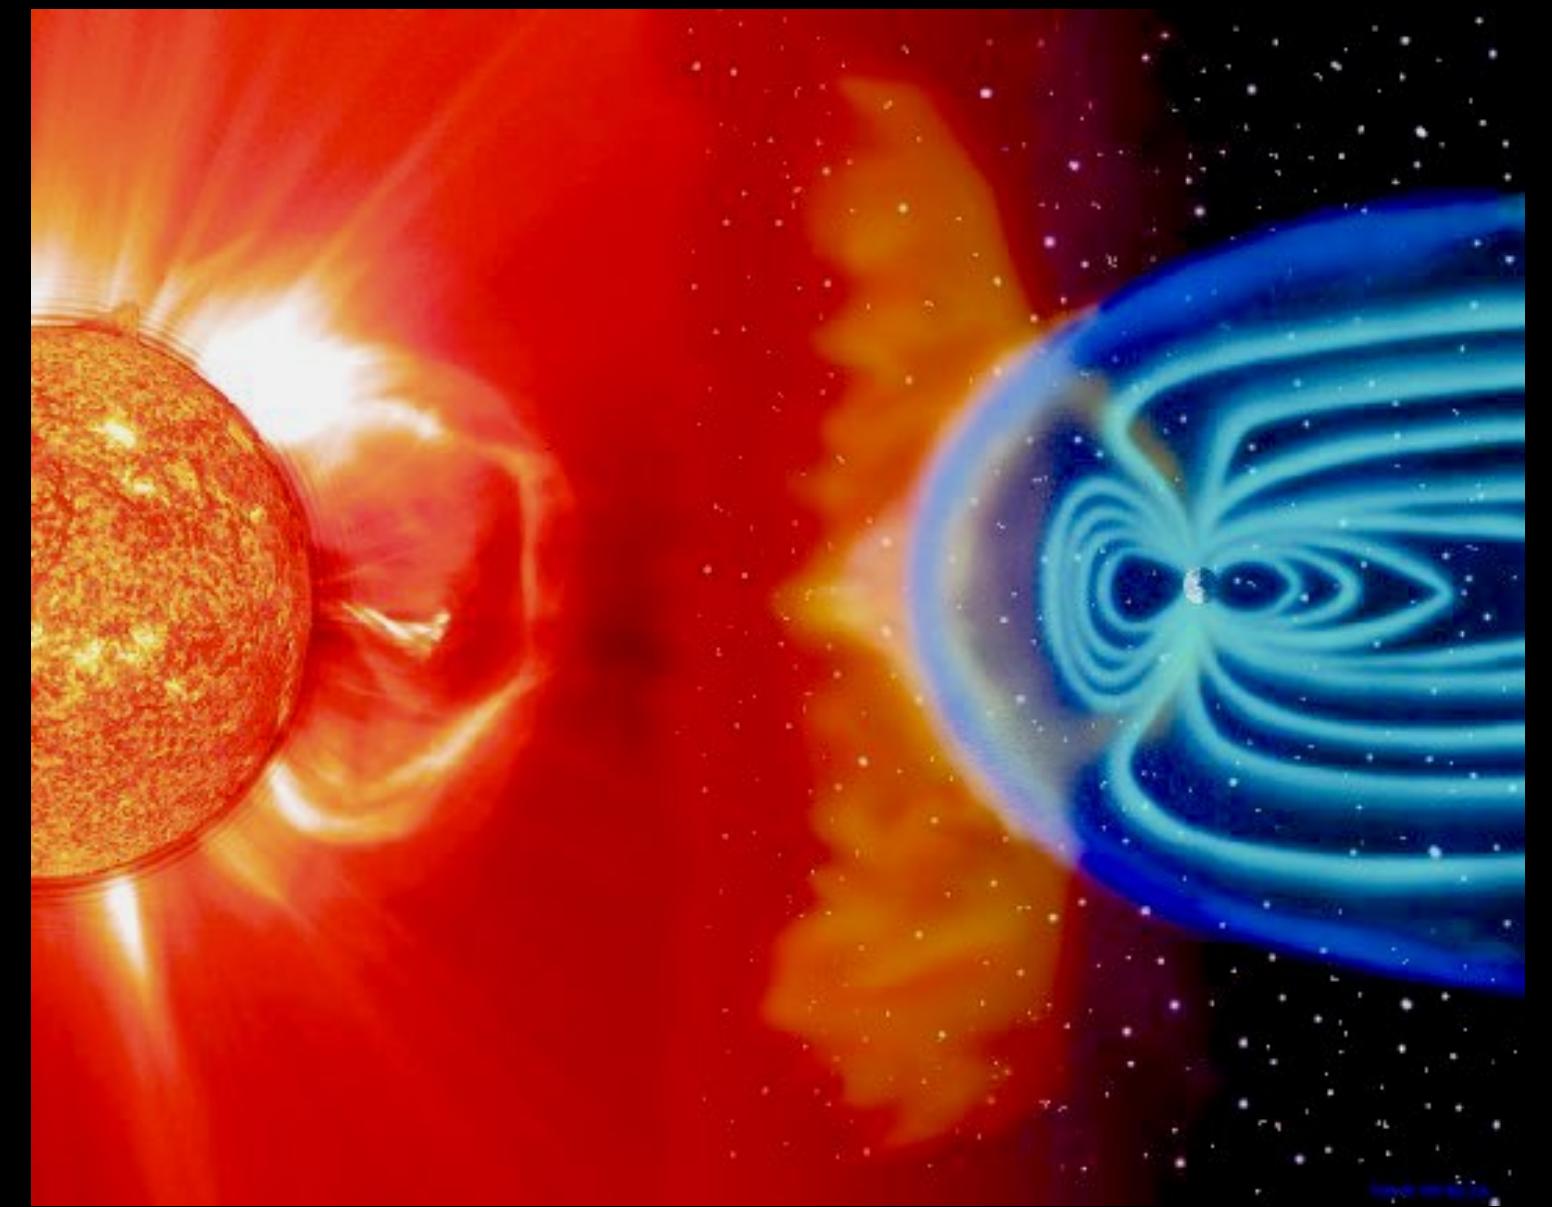

Credits: NASA's Goddard Space Flight Center/SDO

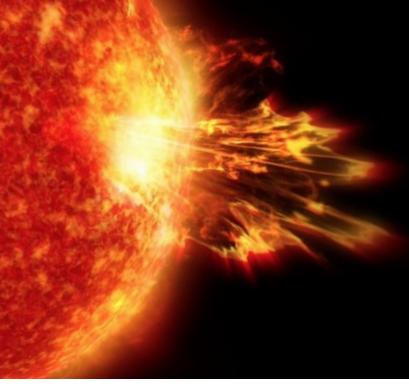

How do CMEs affect us?

- The magnetized emissions are highly directional
- When the earth is in the direct path of a CME, it interacts with the earth's magnetic field
- Large electric fields are produced on the earth's surface through electromagnetic induction

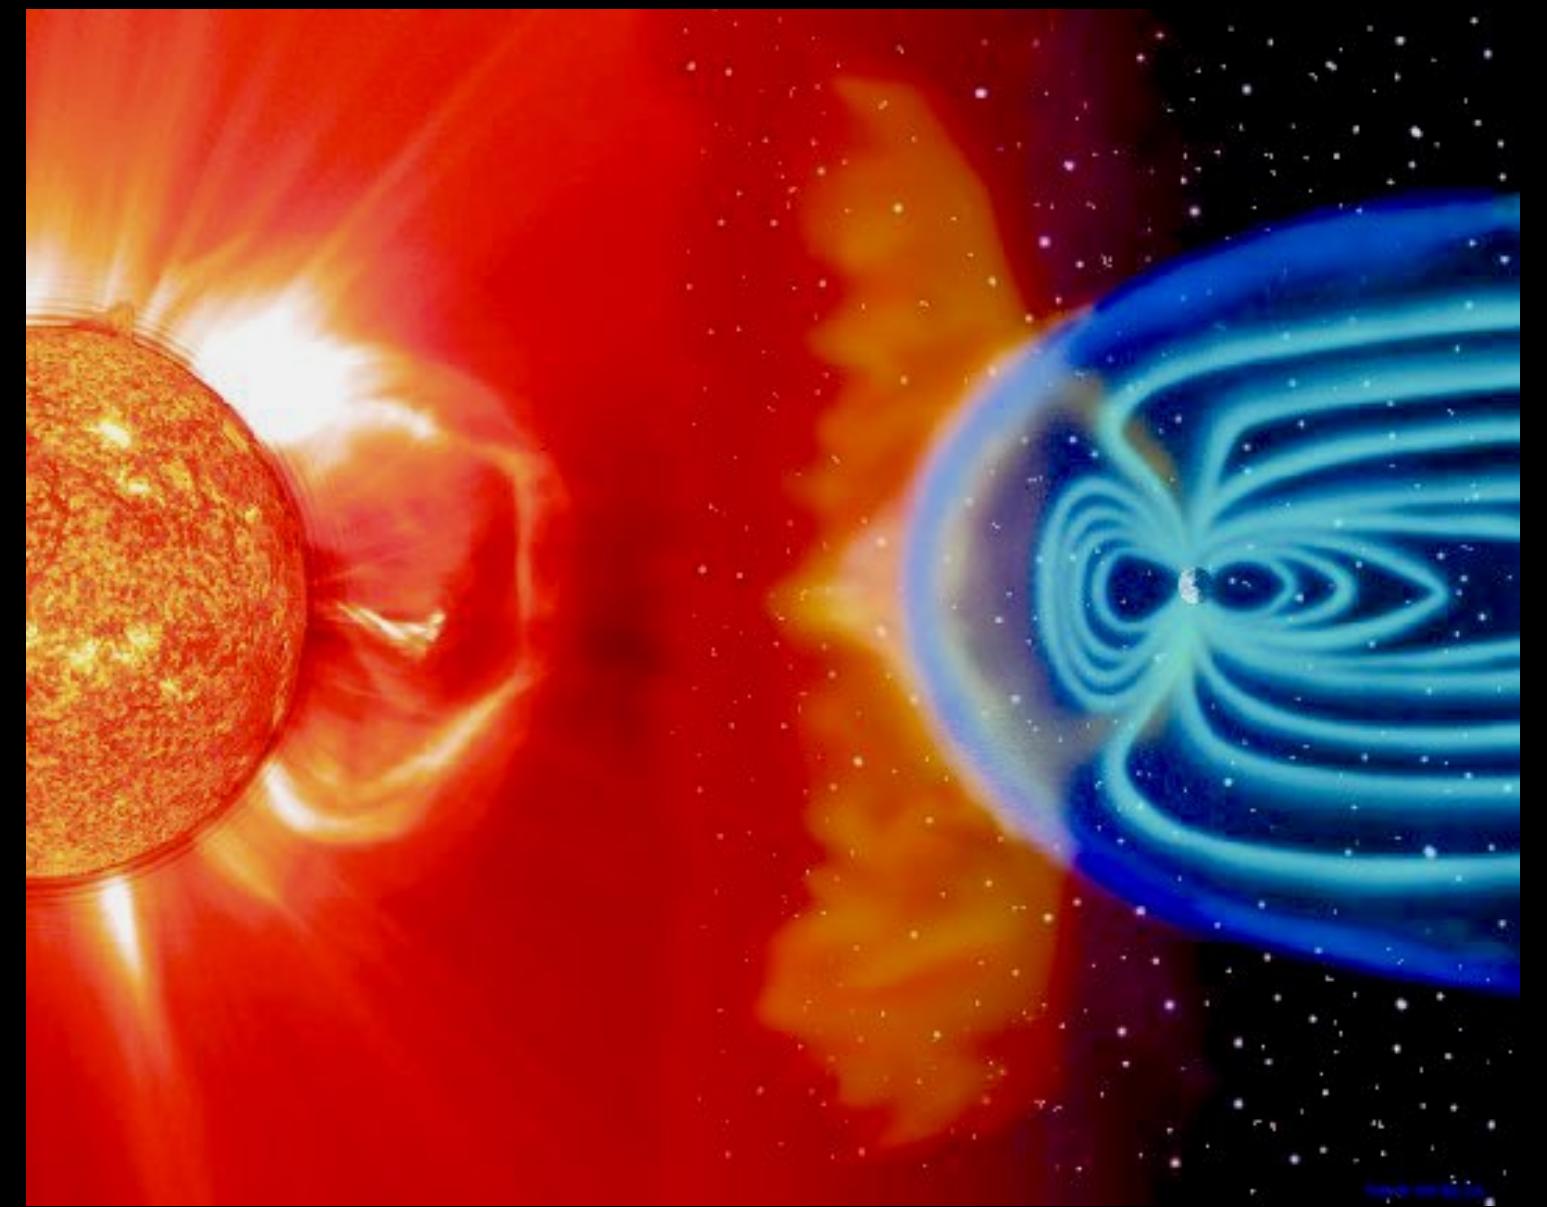

Credits: NASA's Goddard Space Flight Center/SDO

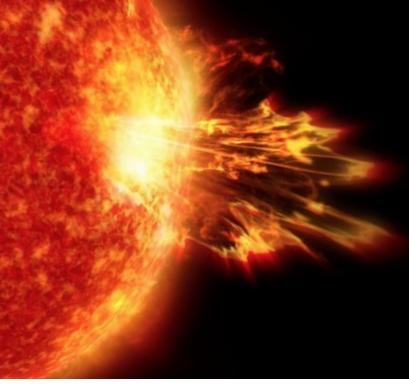

How do CMEs affect us?

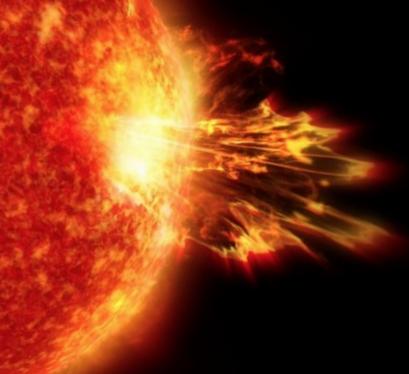

- The magnetized emissions are highly directional
- When the earth is in the direct path of a CME, it interacts with the earth's magnetic field
- Large electric fields are produced on the earth's surface through electromagnetic induction
- Geomagnetically Induced Currents (GIC) can enter long cables like Internet cables and power grid and cause significant damage

Credits: NASA's Goddard Space Flight Center/SDO

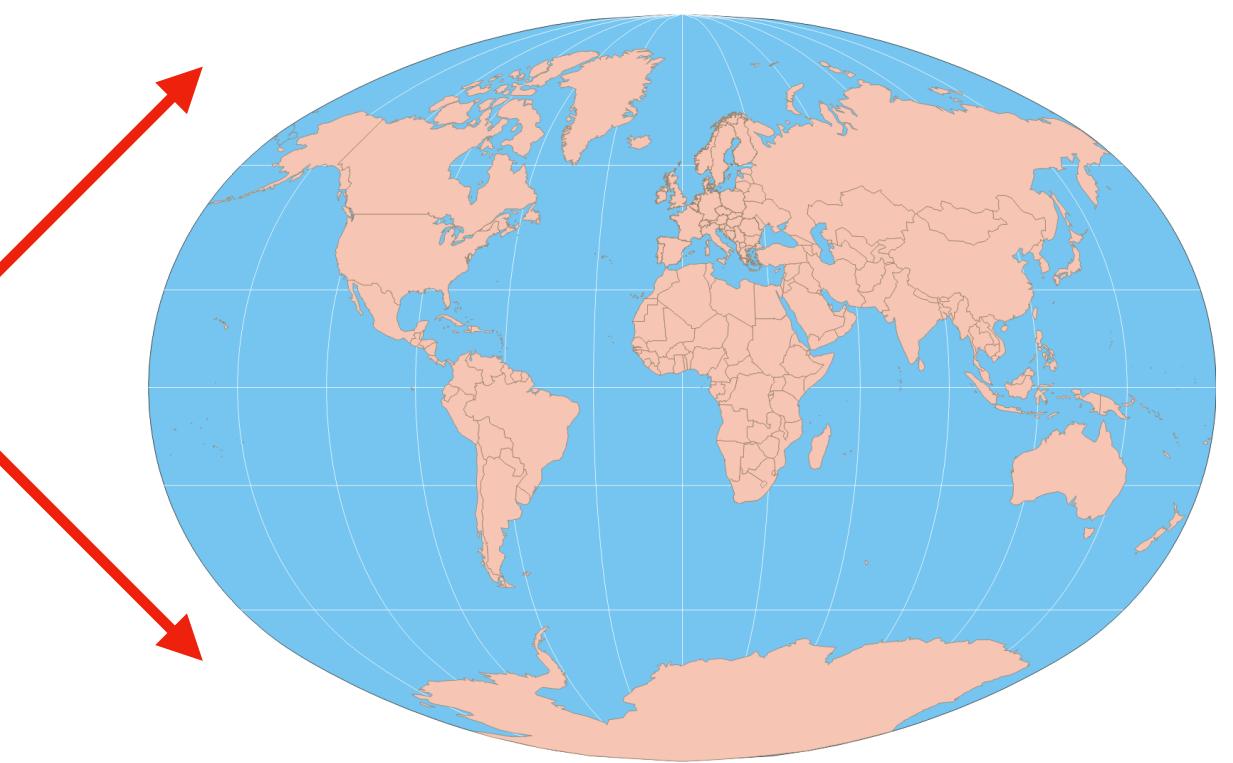

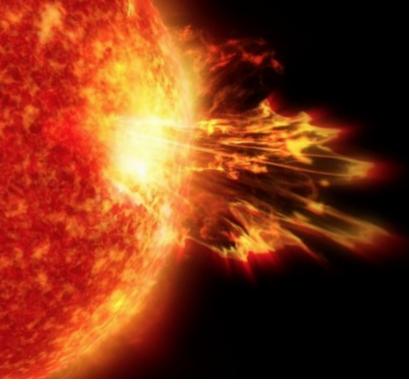

Characteristics of GIC

Characteristics of GIC

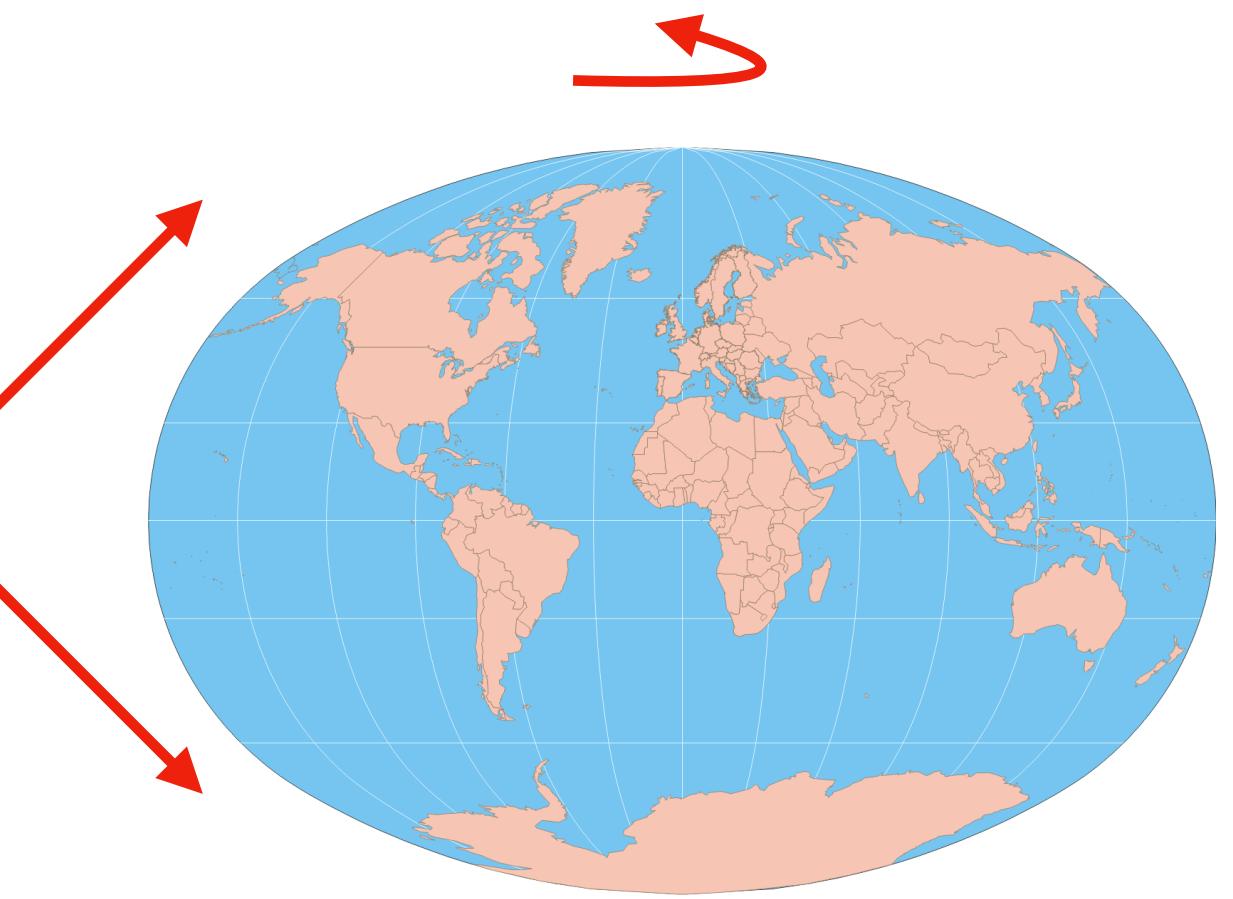

- Higher latitudes are at a significantly higher risk

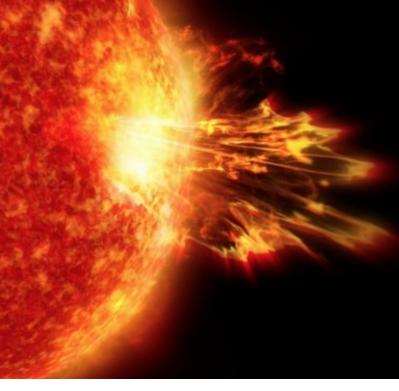

Characteristics of GIC

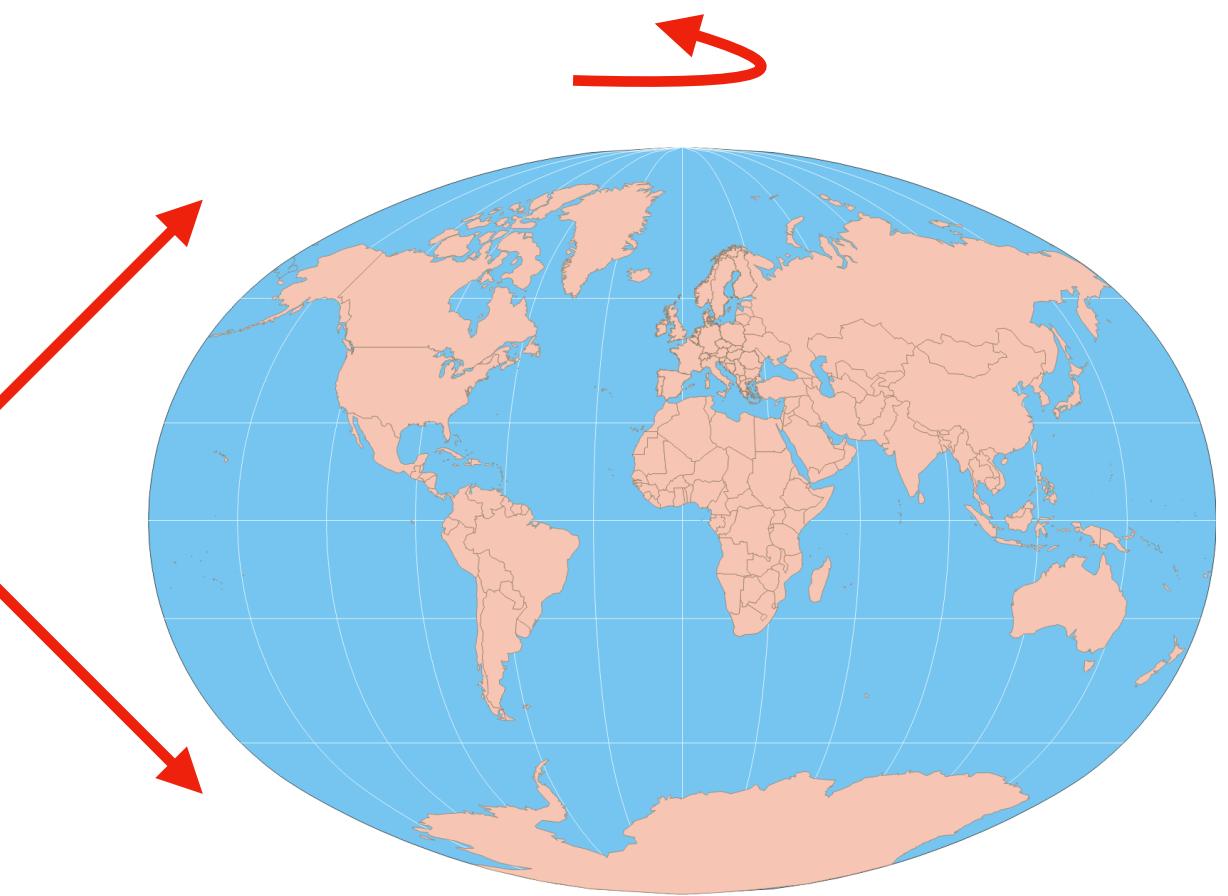

- Higher latitudes are at a significantly higher risk
- GIC affects wide areas and is not restricted to the portion of the earth facing the sun

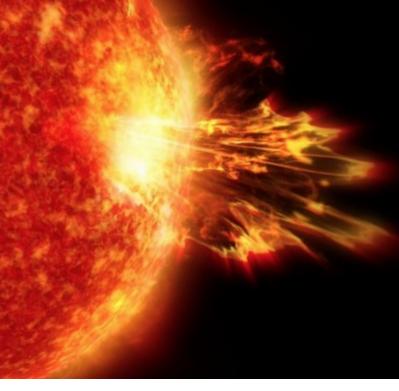

Characteristics of GIC

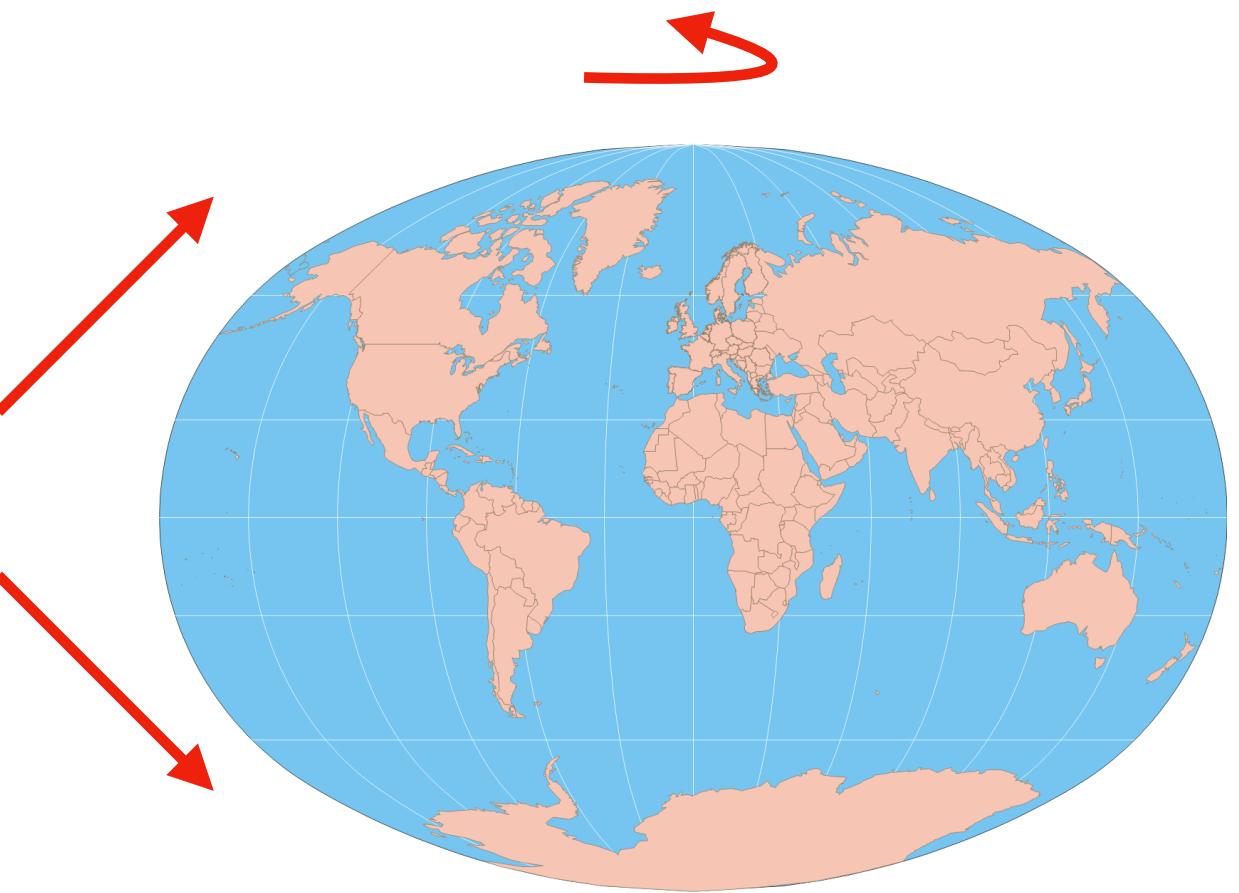

- Higher latitudes are at a significantly higher risk
- GIC affects wide areas and is not restricted to the portion of the earth facing the sun
- GIC is only induced in cables with ground connections

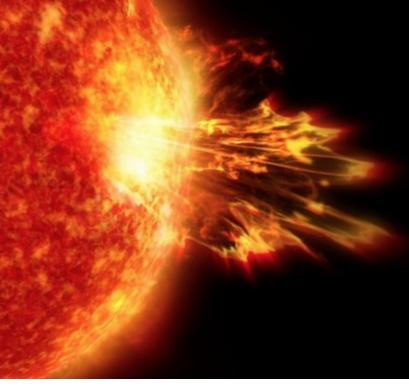

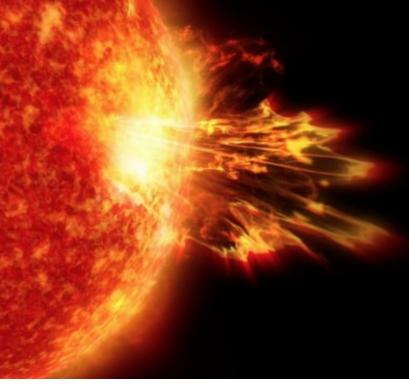

Characteristics of GIC

- Higher latitudes are at a significantly higher risk
- GIC affects wide areas and is not restricted to the portion of the earth facing the sun
- GIC is only induced in cables with ground connections
- Conductors along different orientations on earth are at equal risk

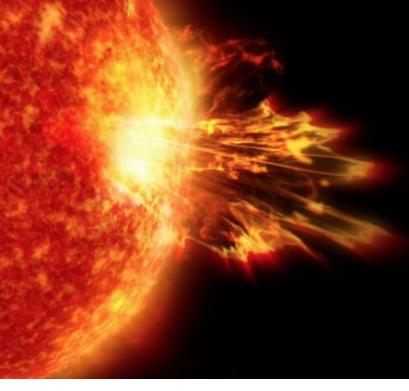

When will it happen next?

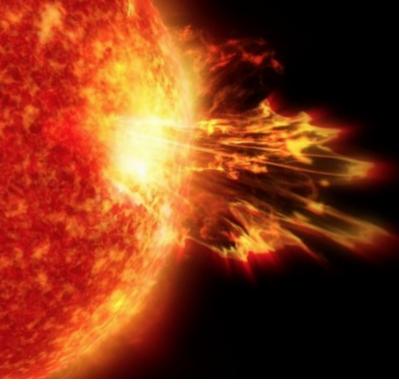

When will it happen next?

- Previous solar superstorms happened in 1859 (Carrington event) and 1921

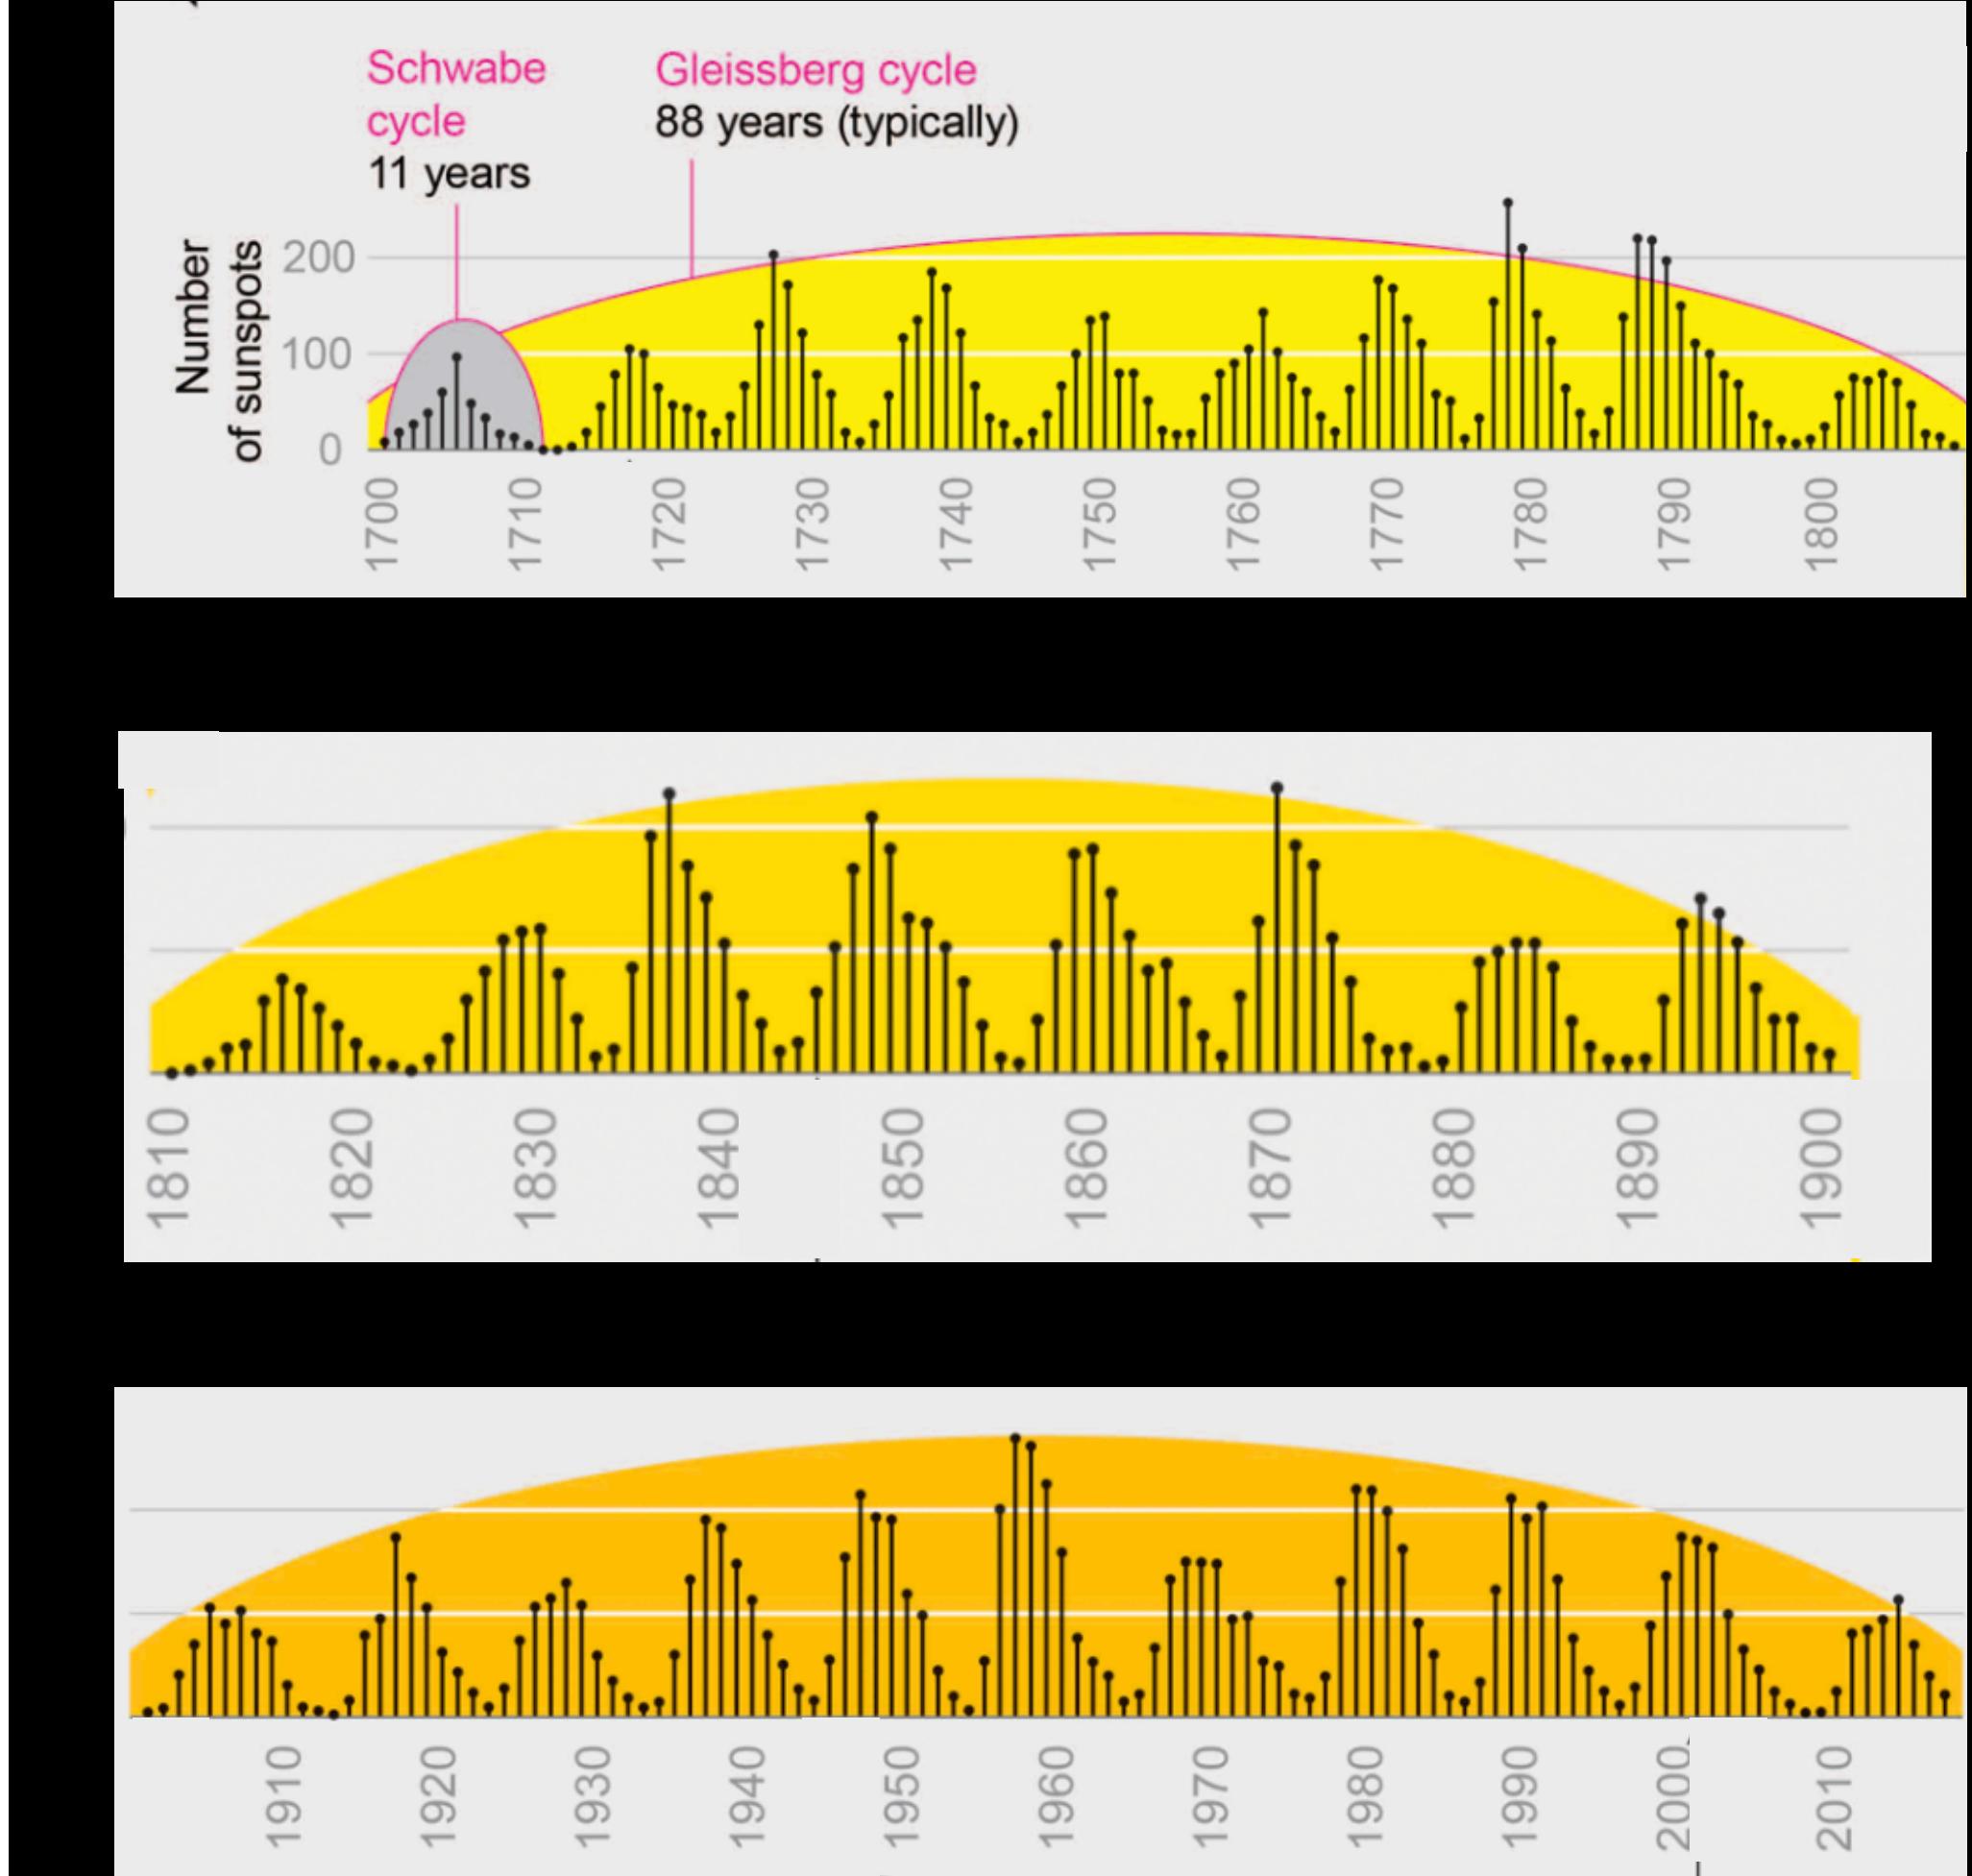

When will it happen next?

- Previous solar superstorms happened in 1859 (Carrington event) and 1921
- The estimates for probability of occurrence ranges from 1.6% to 12% per decade

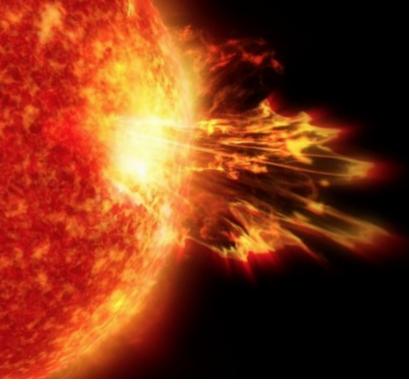

When will it happen next?

- Previous solar superstorms happened in 1859 (Carrington event) and 1921
- The estimates for probability of occurrence ranges from 1.6% to 12% per decade
- The risk is not uniform because solar activity goes through cycles

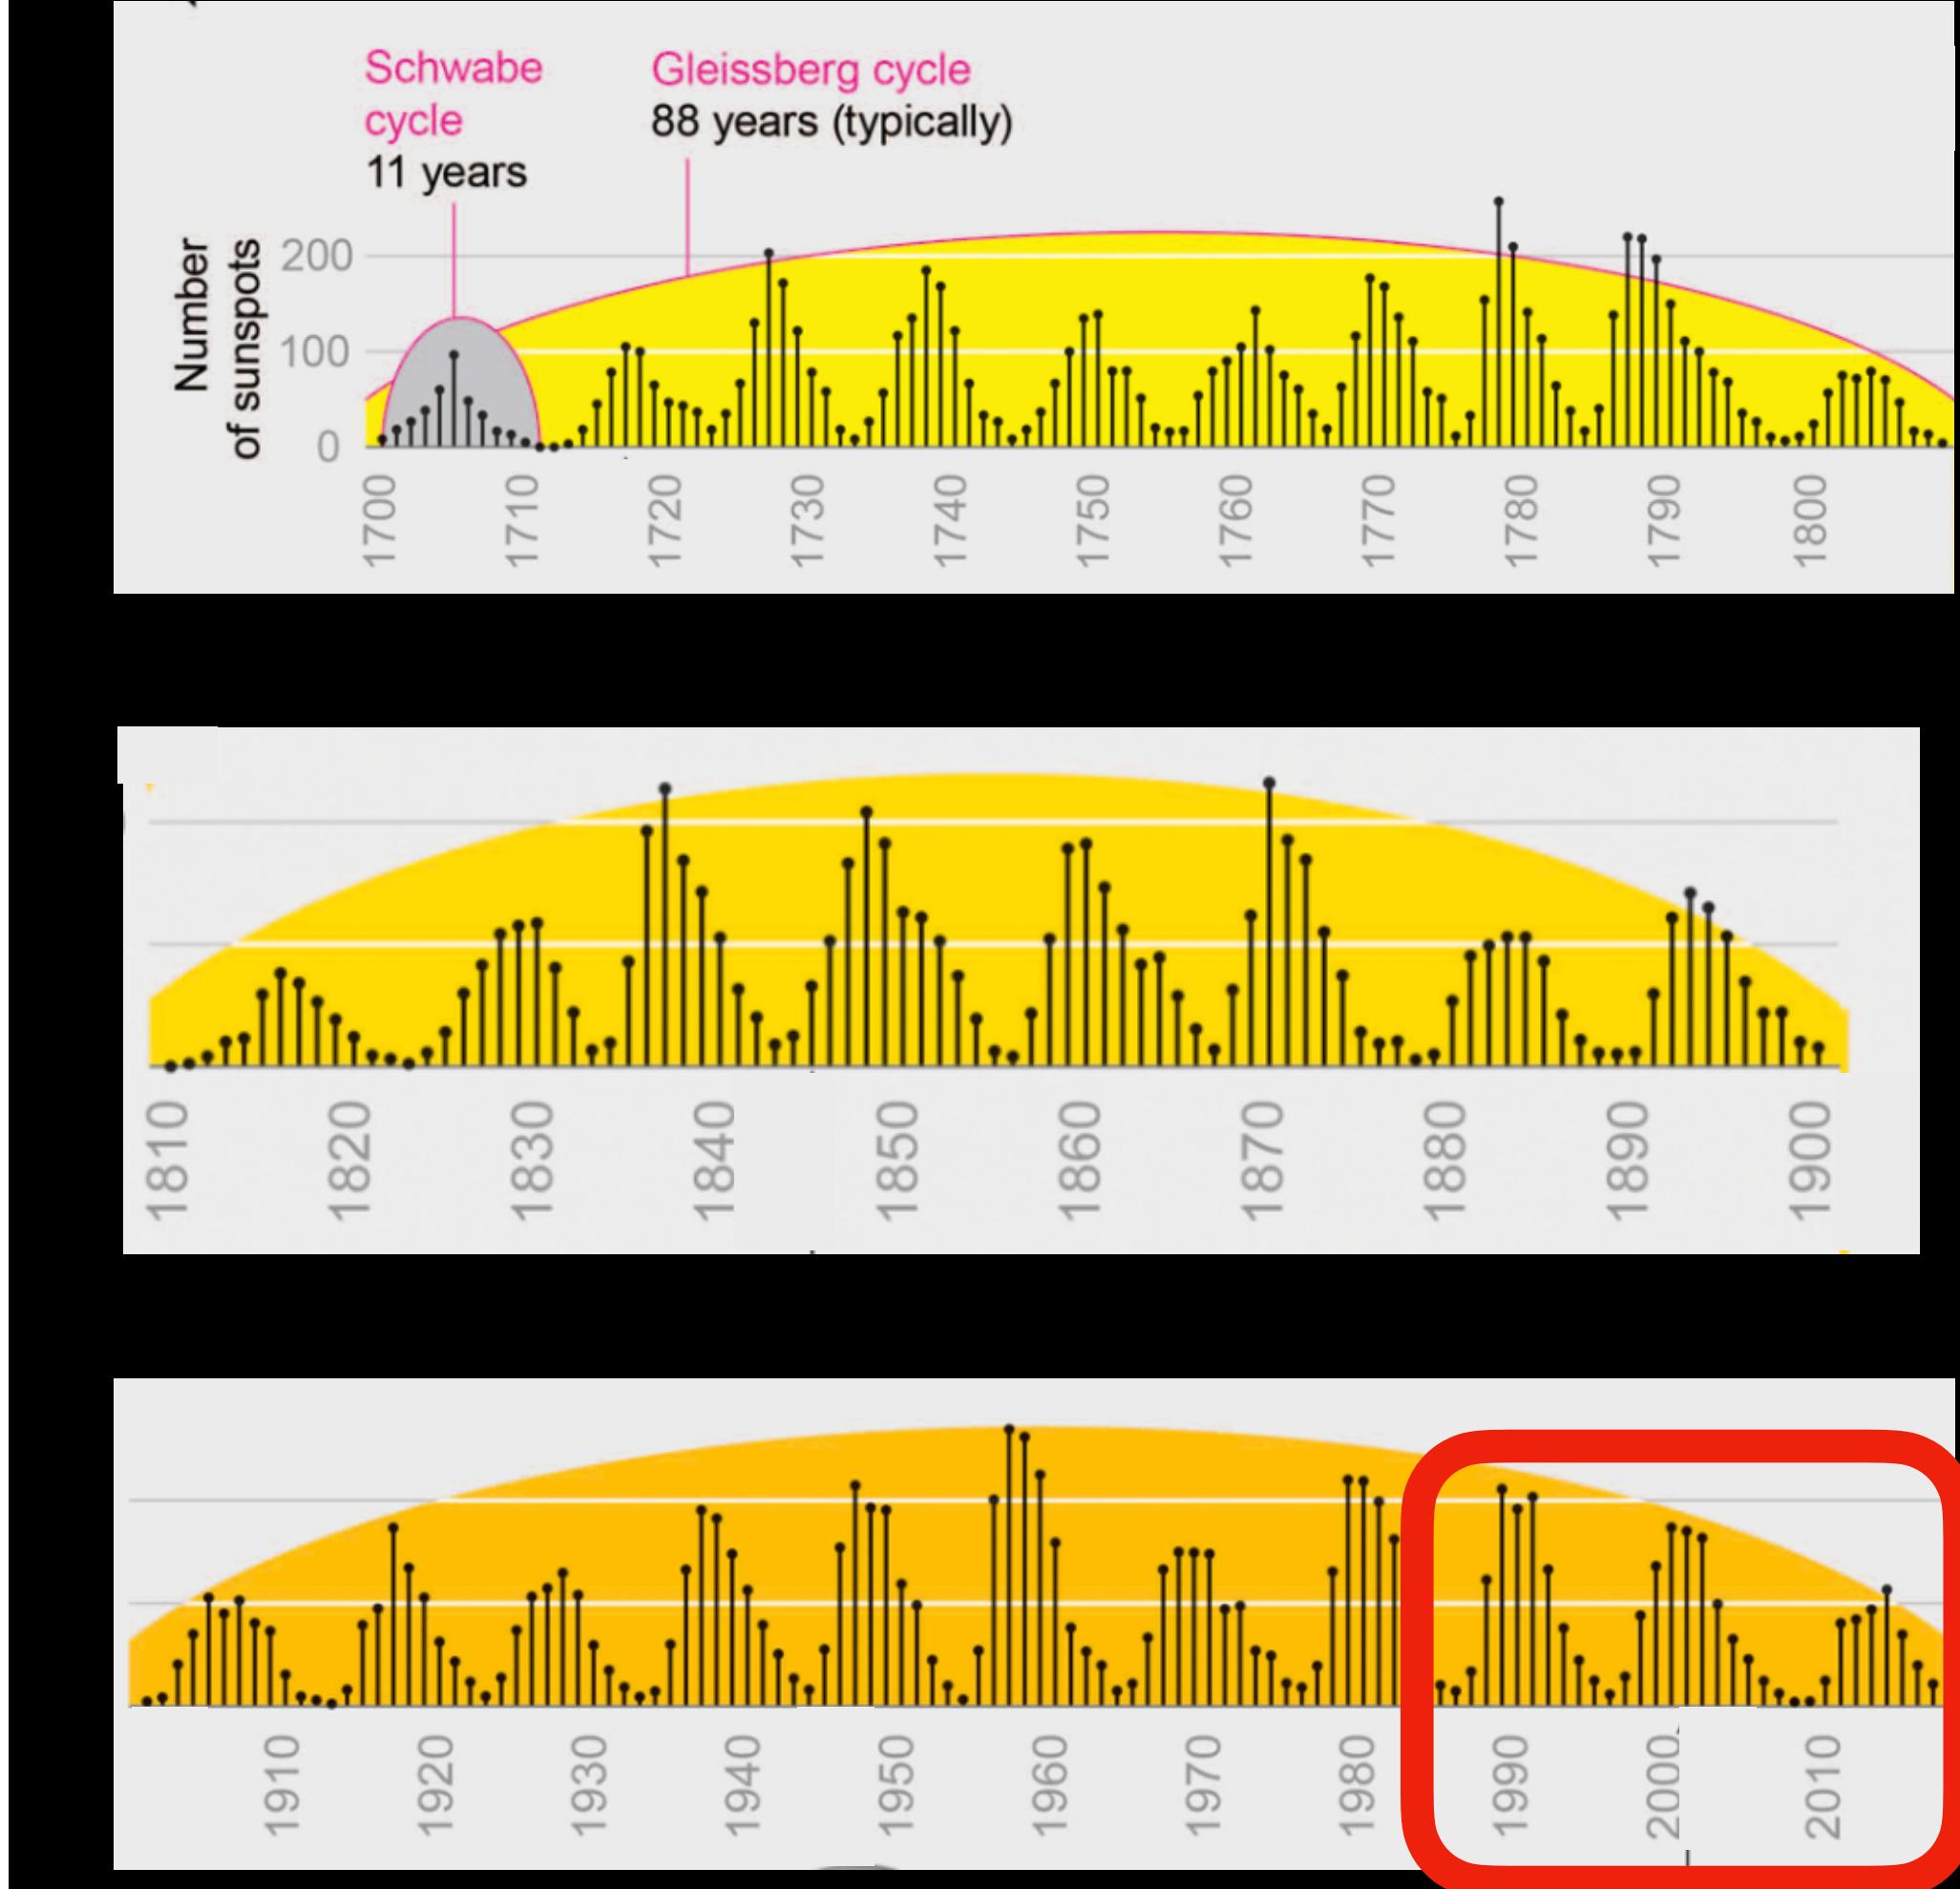

Credits: Katie Peek; Sources: SILSO data, Royal Observatory of Belgium, Brussels

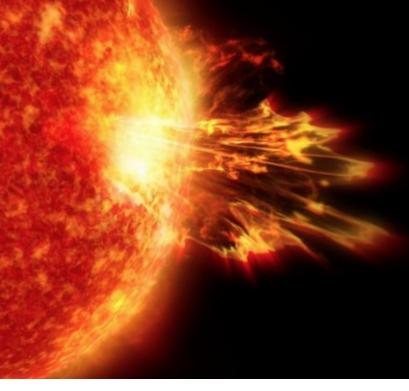

When will it happen next?

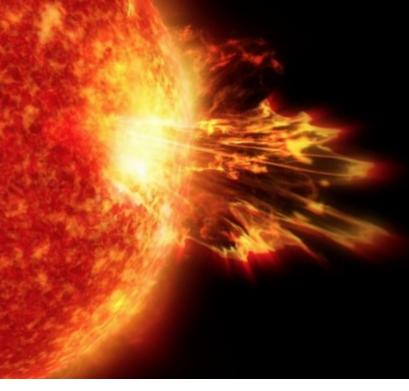

- Previous solar superstorms happened in 1859 (Carrington event) and 1921
- The estimates for probability of occurrence ranges from 1.6% to 12% per decade
- The risk is not uniform because solar activity goes through cycles
- Modern technological advancement coincided with a period of weak solar activity.

Other Internet Infrastructure Components

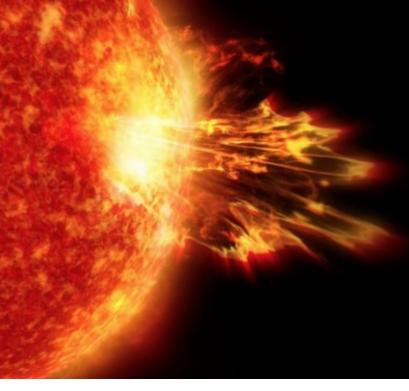

Other Internet Infrastructure Components

- DNS root servers are highly distributed and hence not vulnerable.

Other Internet Infrastructure Components

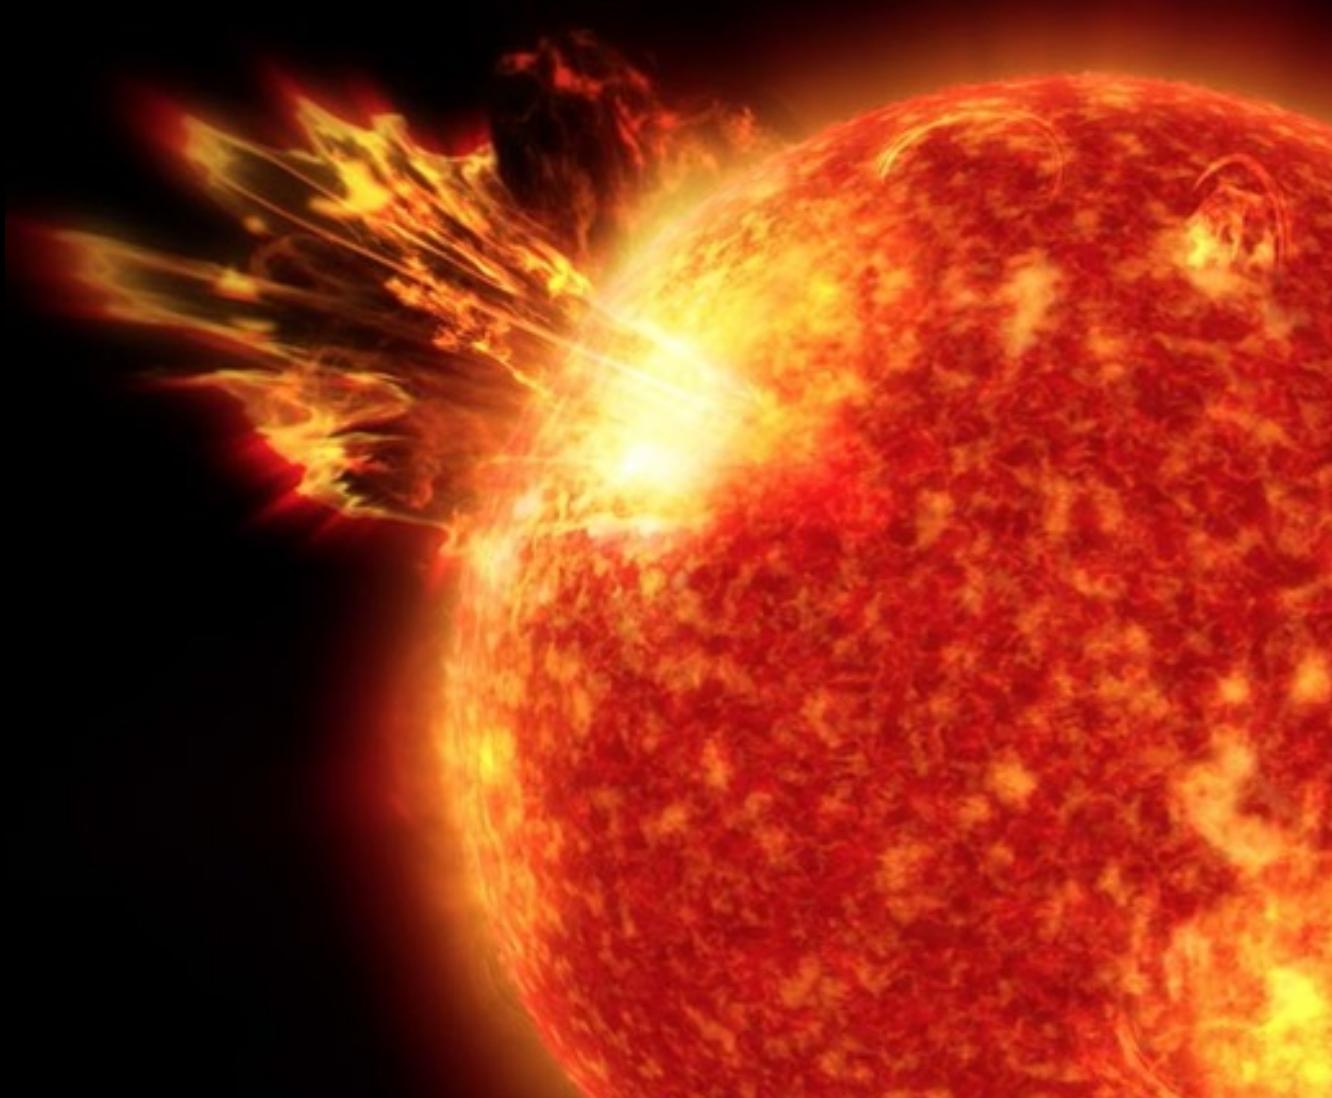

- DNS root servers are highly distributed and hence not vulnerable.
- A large fraction of Autonomous Systems (ASes) have a presence in vulnerable regions

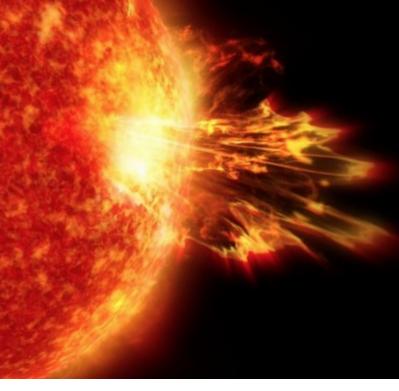

Other Internet Infrastructure Components

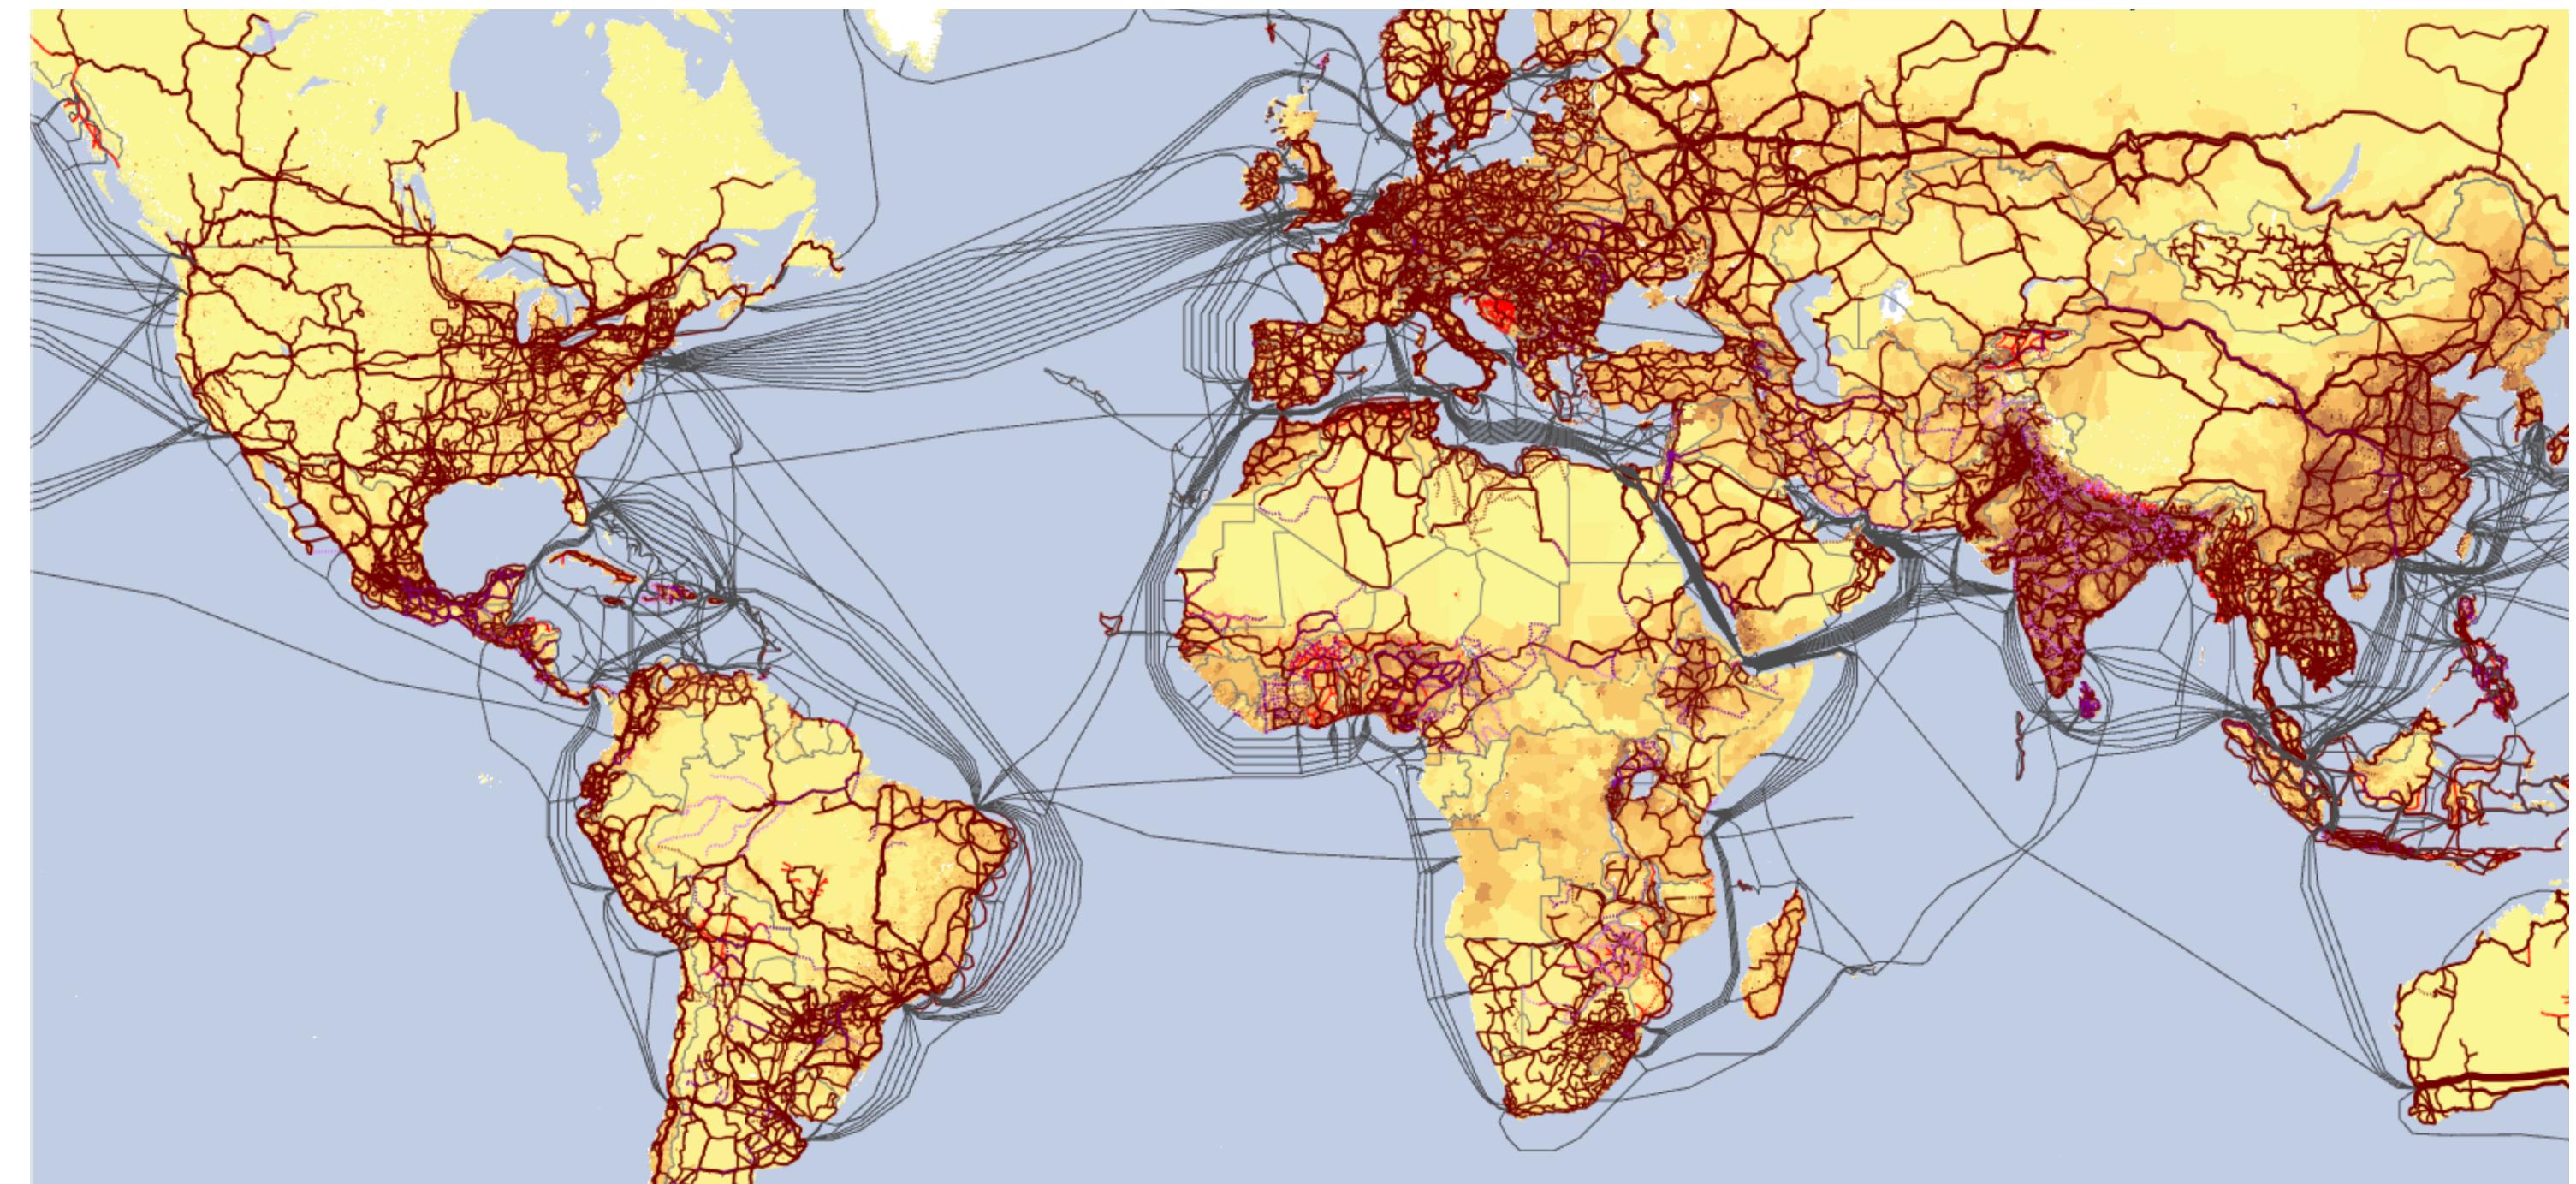

- DNS root servers are highly distributed and hence not vulnerable.
- A large fraction of Autonomous Systems (ASes) have a presence in vulnerable regions
- The vast majority of ASes have a small spread

Ongoing/Future Work

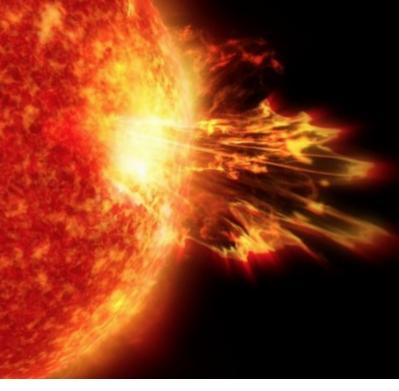

1. End-to-End Analysis of the Risk

2. Robustifying the Internet Infrastructure

- Infrastructure expansion
- Designing new interdomain routing protocols
- How to use the lead time?
- Large-scale failure analysis

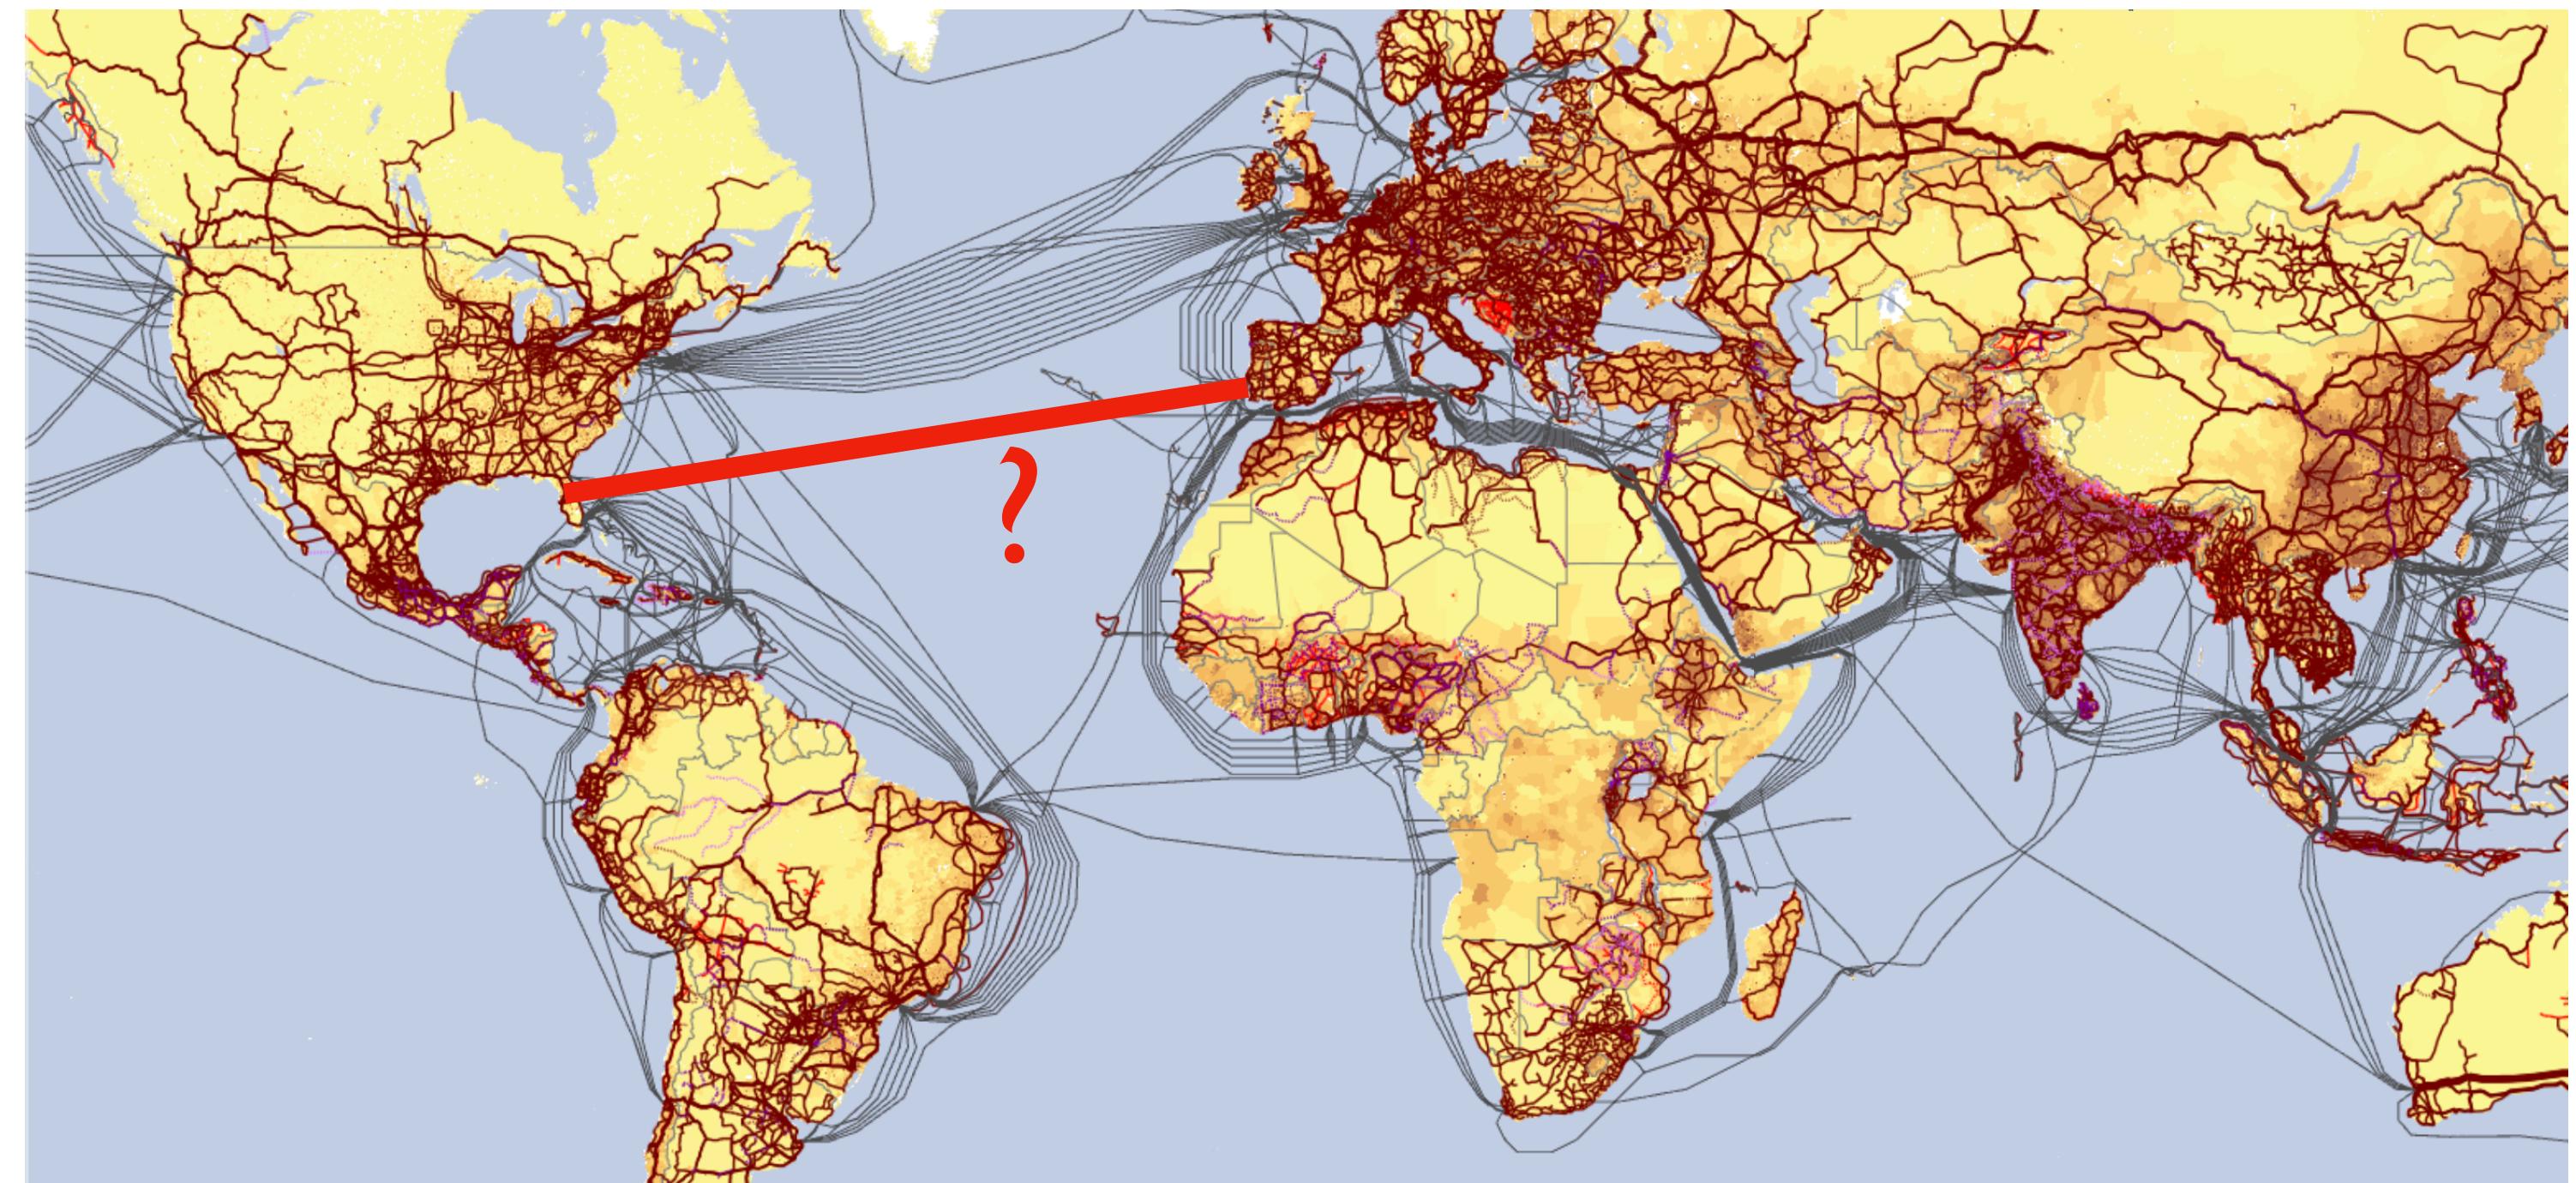

Credits: <https://www.itu.int/itu-d/tnd-map-public/>

3. Reconnecting a Partitioned Internet

We need alternative solutions such as High Altitude Platform Stations (HAPS) that rely on renewable energy

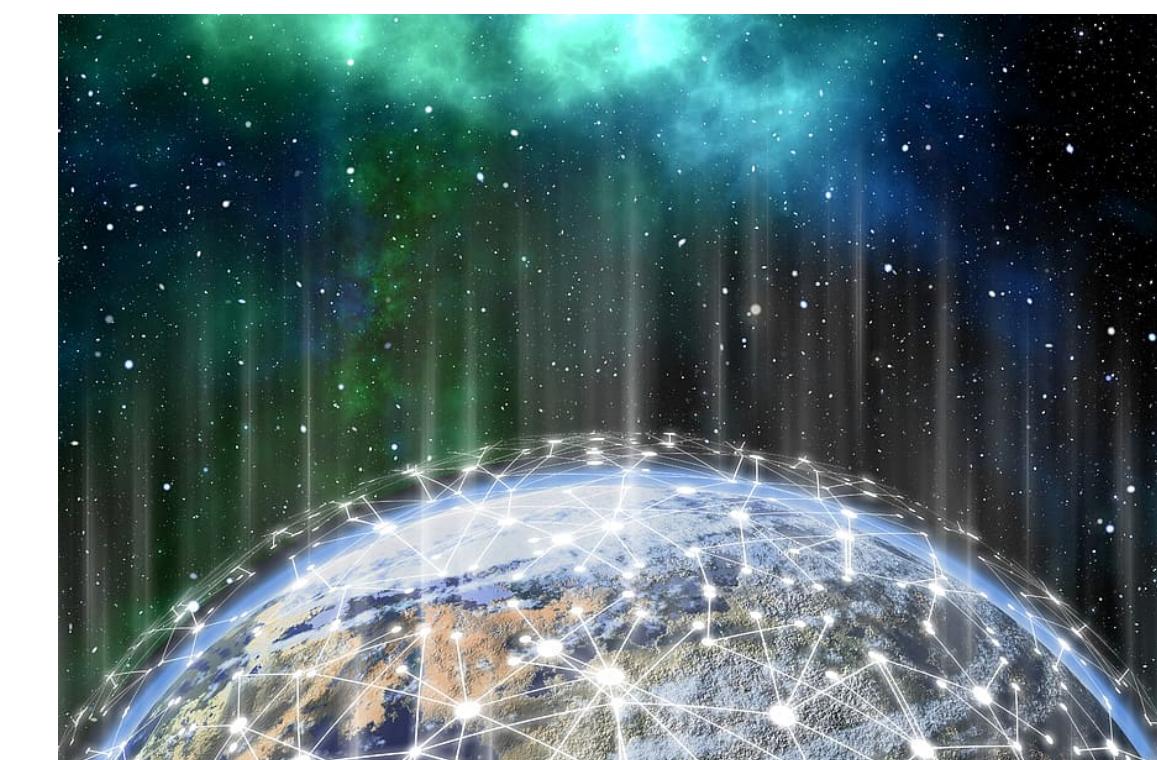

Credits: <https://www.connectivity.technology/2020/10/hapsmobile-and-loon-deliver-4g-from.html>

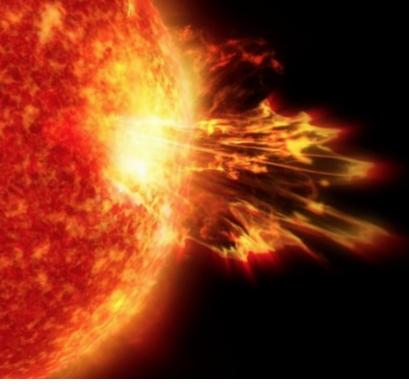

4. Interdependence with Power Grids

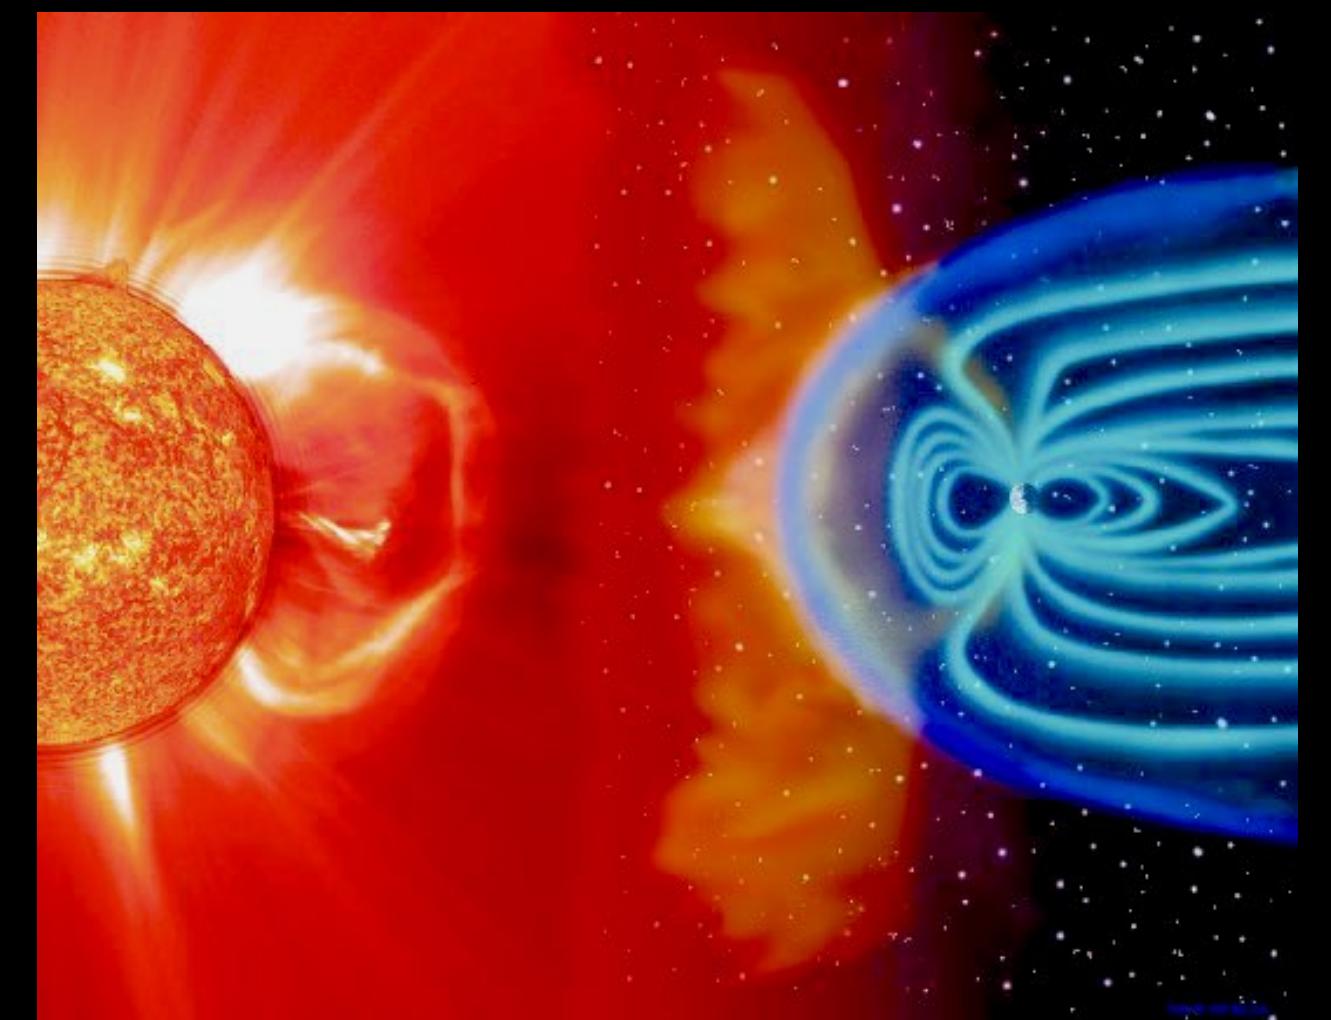

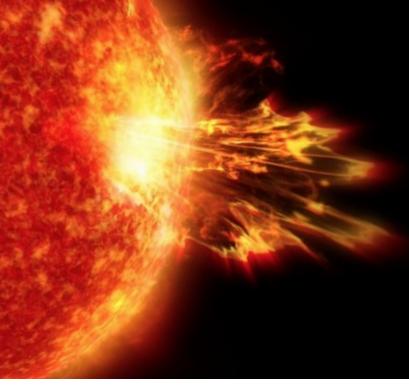

Power grids and the Internet are inter-dependent networks that are both vulnerable to CMEs

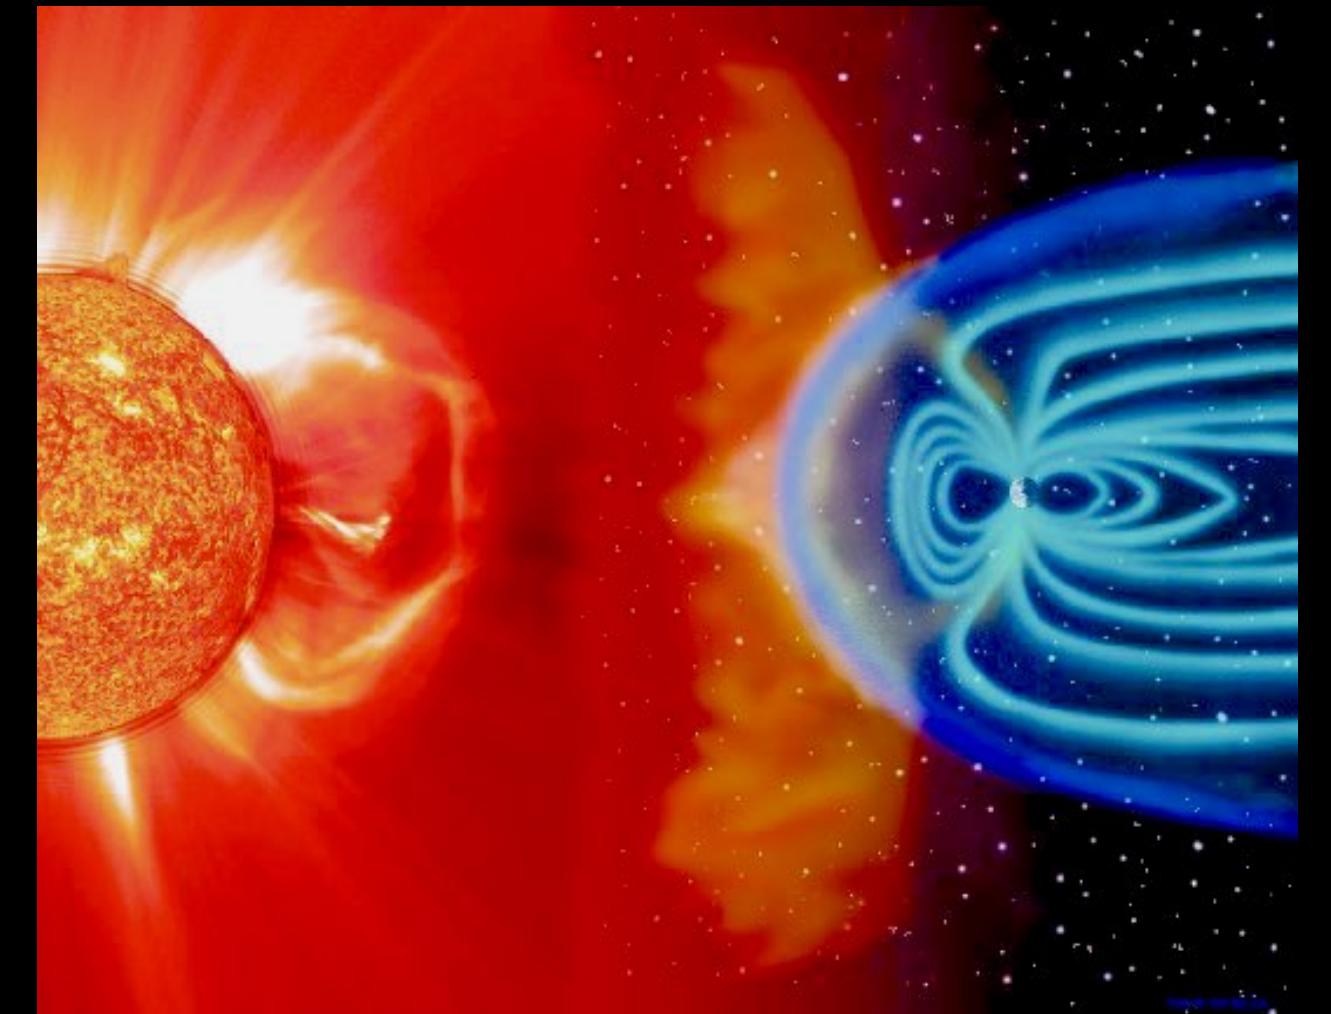

Summary

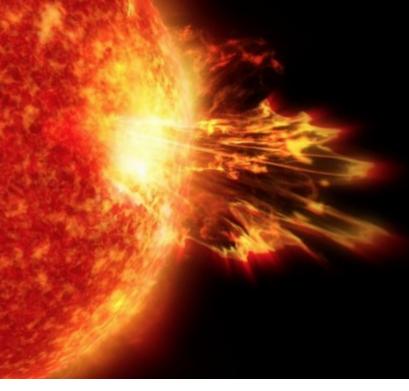

Summary

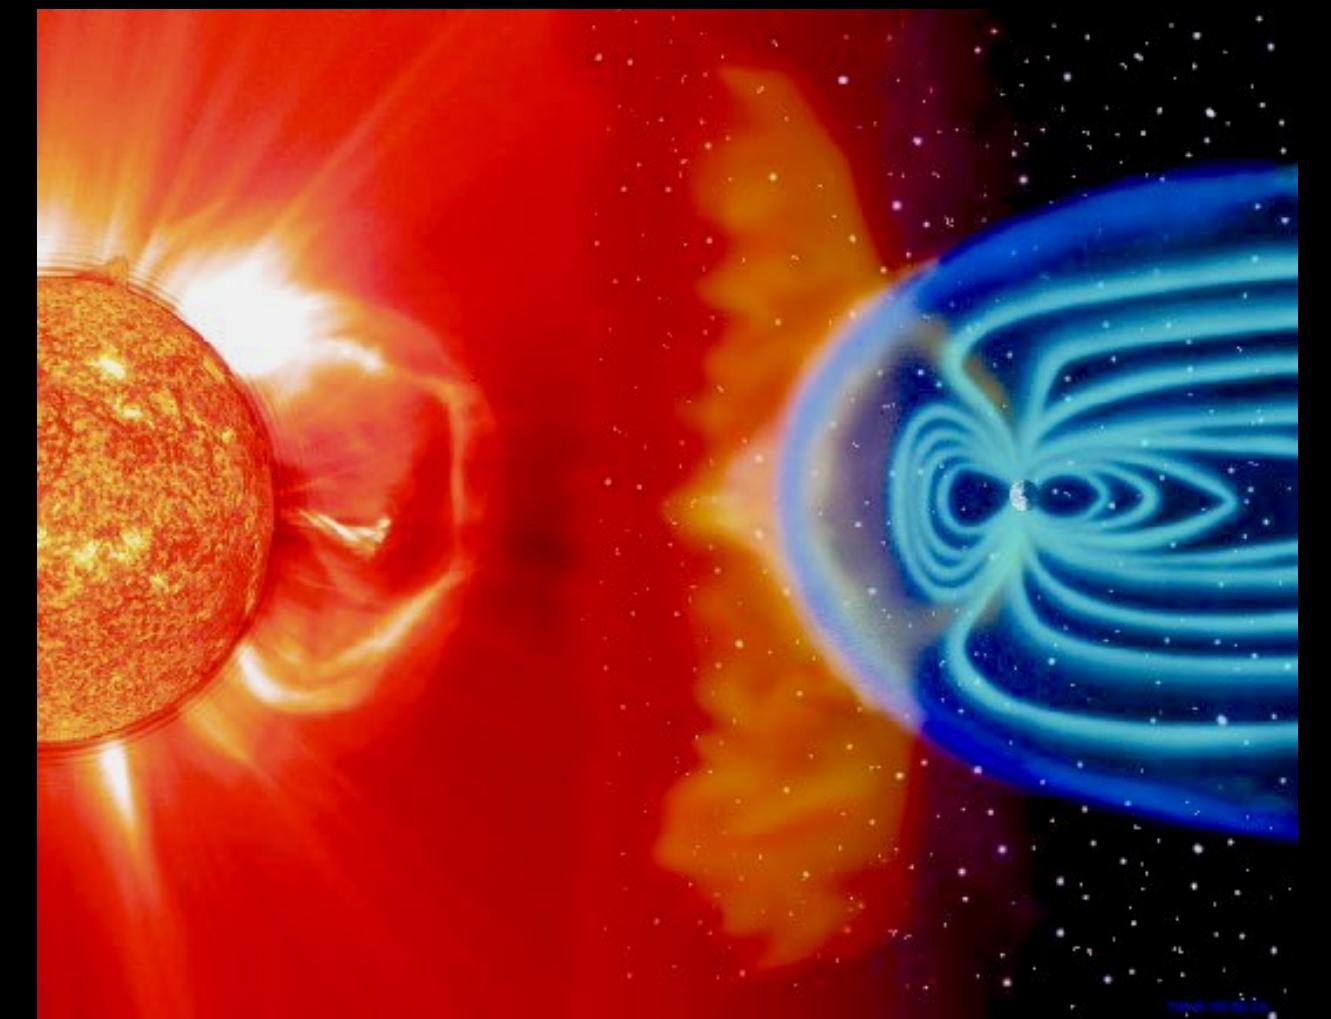

- Space weather poses a risk to the Internet infrastructure

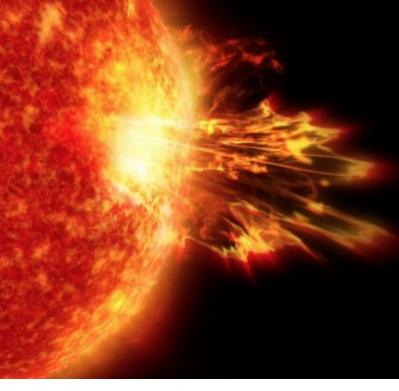

Summary

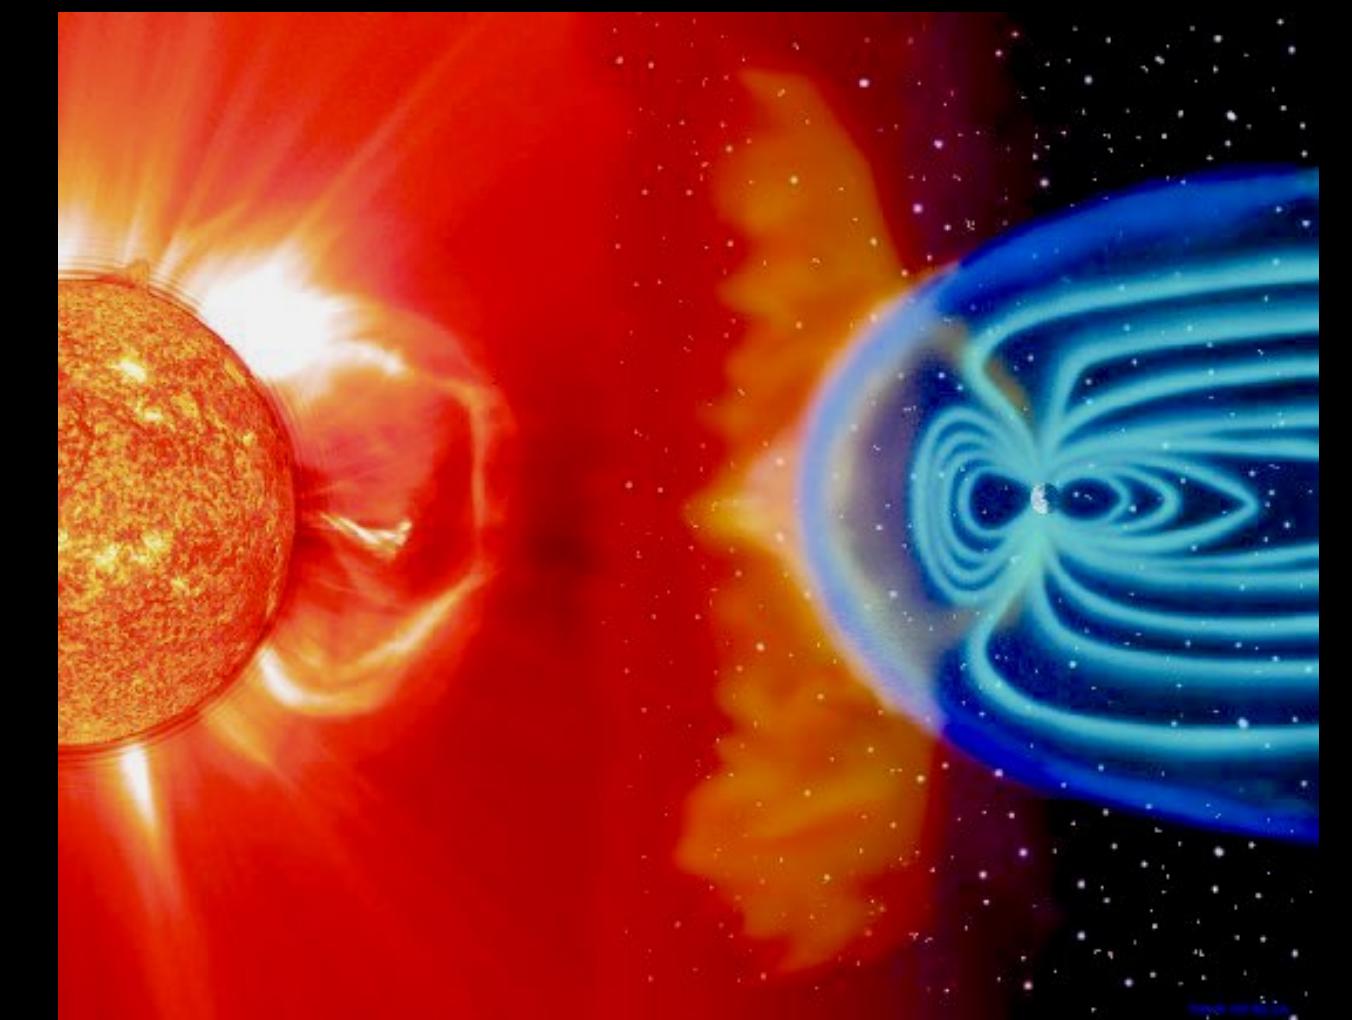

- Space weather poses a risk to the Internet infrastructure
- The Internet infrastructure has not been stress tested under strong solar events.

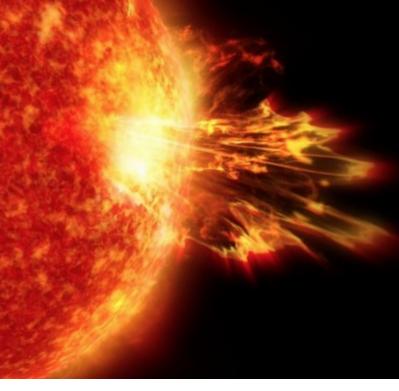

Summary

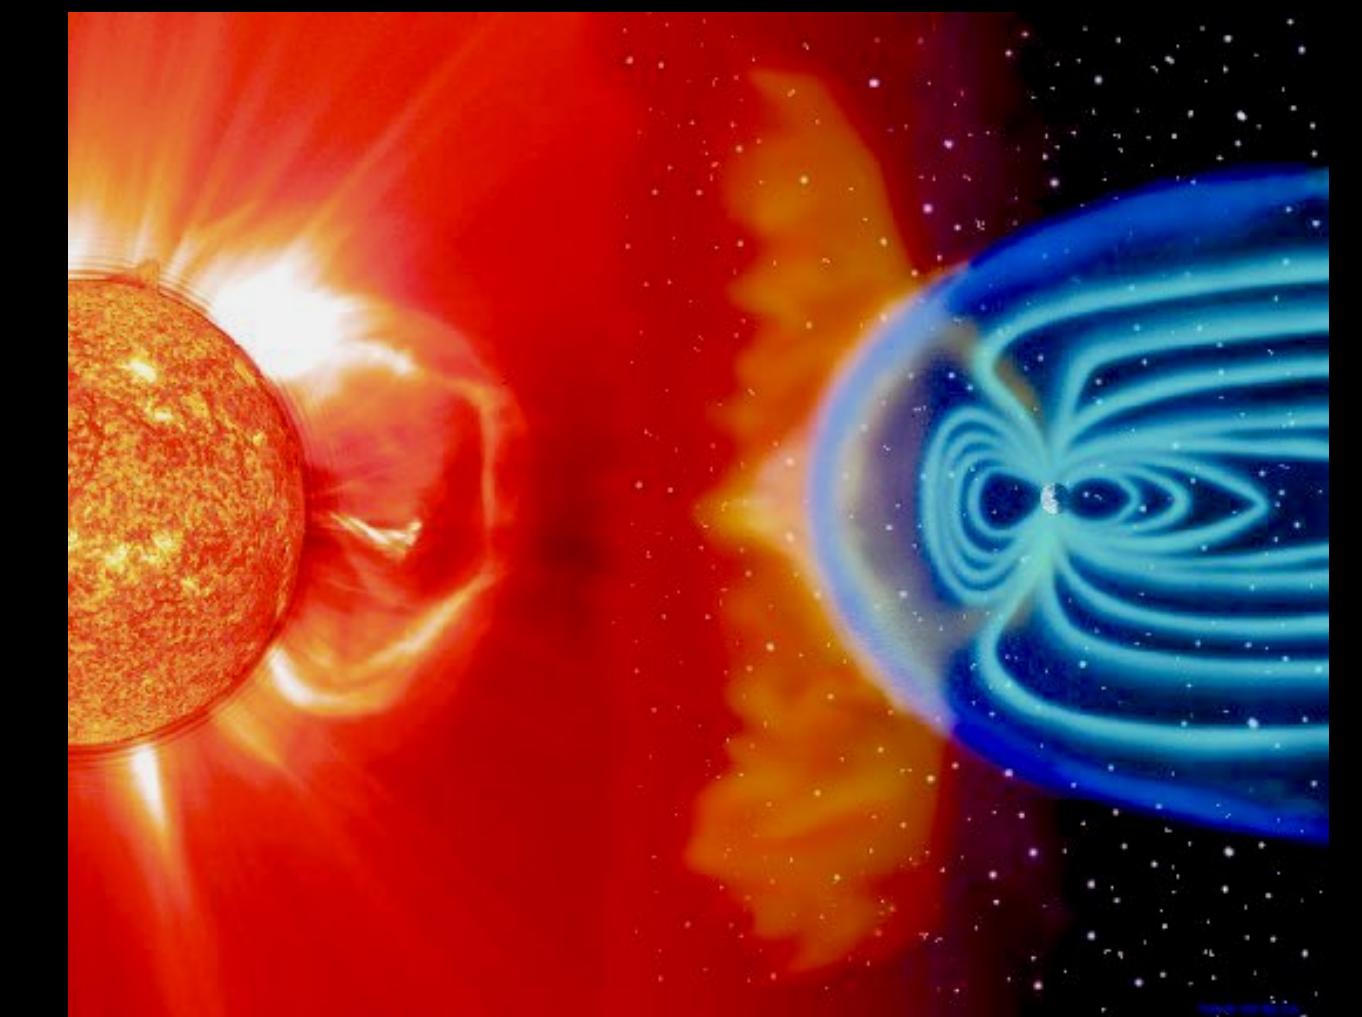

- Space weather poses a risk to the Internet infrastructure
- The Internet infrastructure has not been stress tested under strong solar events.
- Internet infrastructure components are skewed towards highly vulnerable regions.

Summary

- Space weather poses a risk to the Internet infrastructure
- The Internet infrastructure has not been stress tested under strong solar events.
- Internet infrastructure components are skewed towards highly vulnerable regions.
- We need to work towards better understanding and improving the resilience of the global Internet infrastructure.

Thank You!
